Company: \_\_\_\_\_

Course Date: \_\_\_\_\_

Course Number: 431R400

Name \_\_\_\_\_

Date \_\_\_\_\_

**431R400****PlantScape Controller Implementation****Course Description**

This five day course is designed to enable the student to configure and program the PlantScape Controller. The course has a real world context and all exercises are used to create a functional hybrid control application. In addition, it provides instruction on server ControlNet configuration and the use of Knowledge Builder.

**Course Modules**

<b>Module Name</b>	<b>Module No.</b>	<b>Time (hrs)</b>	<b>Student Signoff</b>	<b>Manager Signoff</b>
Course Description and Modules	M431R400	0	_____	_____
PlantScape Controller Implementation Bk1	431Book1	0	_____	_____
Introduction to PlantScape	431U1Intro	0	_____	_____
Navigating Knowledge Builder	431U1L1	0	_____	_____
Using Control Builder	431U1L2	0	_____	_____
Configuring Your Server	431U1L3	0	_____	_____
Unit 1 Exam	431U1tst	0	_____	_____
Use and Configuration of PlantScape Hardware	431U2Intro	0	_____	_____
PlantScape Hardware Configuration	431U2L1	0	_____	_____
Configuring a Control Processor Module (CPM)	431U2L2	0	_____	_____
Configuring Digital and Analog IOMs	431U2L3	0	_____	_____
PlantScape Ntools Familiarization	431U2L4	0	_____	_____
Unit 2 Exam	431U2tst	0	_____	_____
Introduction to Creating Control Modules	431U3Intro	0	_____	_____
Configuring a Continuous Control Strategy	431U3L1	0	_____	_____
Configuring the Heat Cascade	431U3L2	0	_____	_____
Loading, Activating, and Operating Control Modules	431U3L3	0	_____	_____
PlantScape DbAdmin Familiarization	431U3L4	0	_____	_____
Unit 3 Exam	431U3tst	0	_____	_____
Device Control CMs	431U4Intro	0	_____	_____
Configuring a 2-State Device Control CM	431U4L1	0	_____	_____
Configuring a 3-State Device Control CM	431U4L2	0	_____	_____
Control Module Skill Development	431U4L3	0	_____	_____
Unit 4 Exam	431U4tst	0	_____	_____
Creating Auxiliary CMs	431U5Intro	0	_____	_____
Configuring a Reg Control CM with Simulated I/O	431U5L1	0	_____	_____
Configuring a Flow Totalizer	431U5L2	0	_____	_____
Building Level Indicators	431U5L3	0	_____	_____
Building a Digital Input CM	431U5L4	0	_____	_____
Unit 5 Exam	431U5tst	0	_____	_____
Interlocks and Messages	431U6Intro	0	_____	_____
Configuring Operational Interlocks	431U6L1	0	_____	_____
Configuring Safety Override Interlocks	431U6L2	0	_____	_____
Manual Operation	431U6L3	0	_____	_____

# **Unit 1**

## **Introduction To PlantScape**

---

---

**Honeywell**

# **PlantScape Controller Implementation**

## **Lesson 1**

### **Navigating Knowledge Builder**

---

1 - 3

---

#### ***Notes***

#### **Introduction**

The purpose of this Lesson is to give you the information to be able to navigate Knowledge Builder. After you complete this Lesson you should be able to identify the procedures to navigate Knowledge Builder.

#### **Objectives**

- ❶ Given a list of statements, correctly identify the methods of accessing Knowledge Builder
- ❷ Given a list of definitions, correctly identify the definitions of Knowledge Builder Guide, Reference Manual and Theory Manual

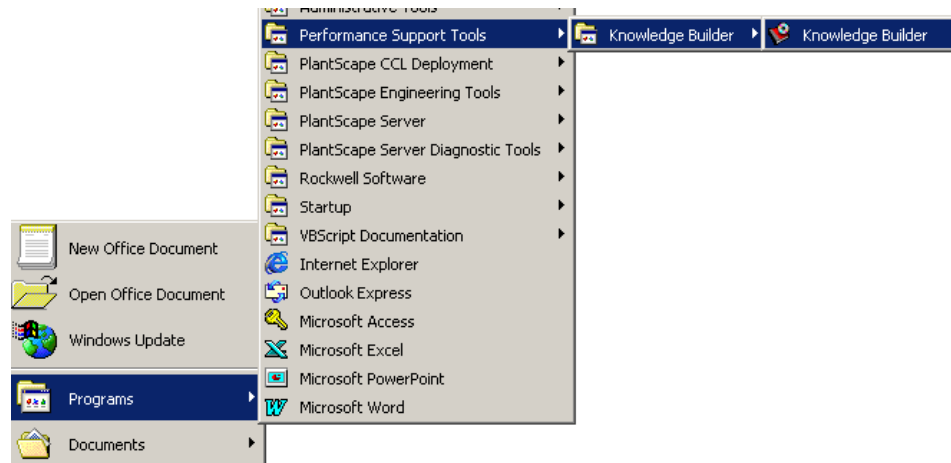

## **Starting Knowledge Builder**

### **From the Windows NT Taskbar**

Click:

- **Start**
  - **Programs**
    - **Performance Support Tools**
      - **Knowledge Builder**
        - **Knowledge Builder**

1 - 4

## **Notes**

### **Starting Up Knowledge Builder**

You can start up the PlantScape Knowledge Builder from Windows using

- Windows NT Taskbar menus

Additionally, once Control Builder and the Station application are running, you may access the Knowledge Builder from

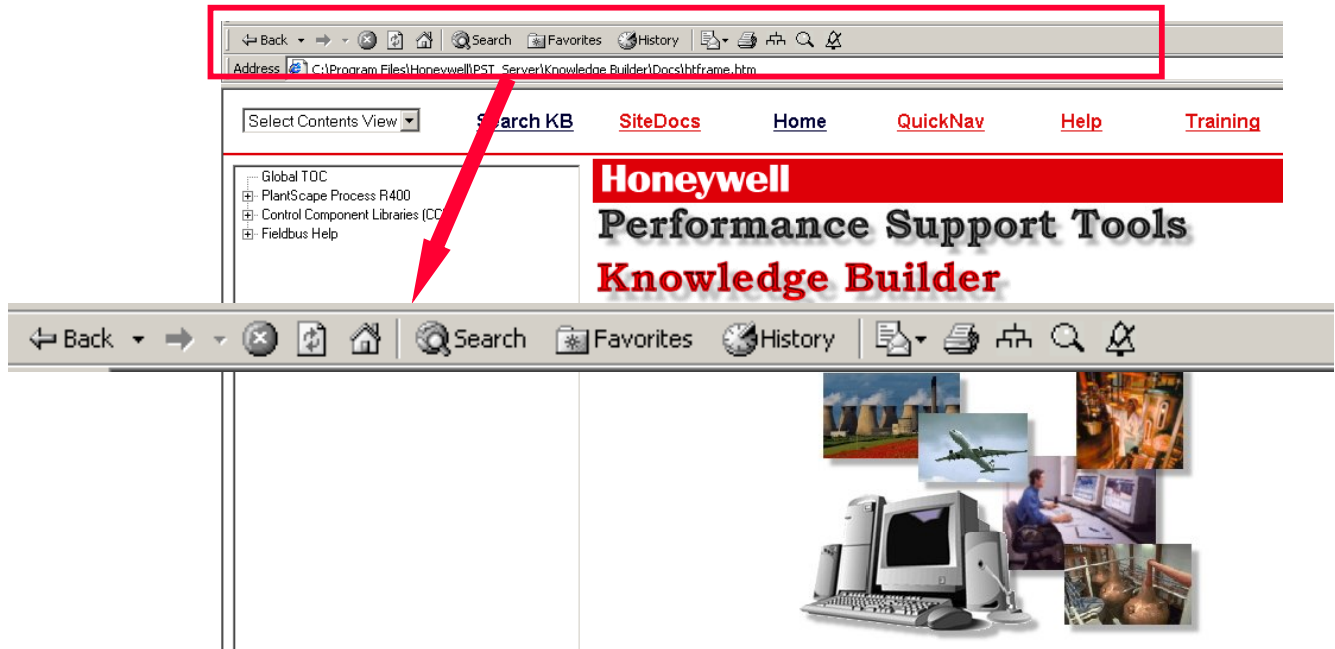

- the pull-down help menus (Help -> Knowledge Builder)
- online help displays via buttons (F1, Help) or hyper-text links (Control Builder only)

## Using the Main Menu

### Browser window

- unique to your browser and includes generic browser functions

1 - 5

### Notes

The Main Menu gives you a graphical easy-to-navigate interface for accessing PlantScape information. The Main Menu consists of two windows

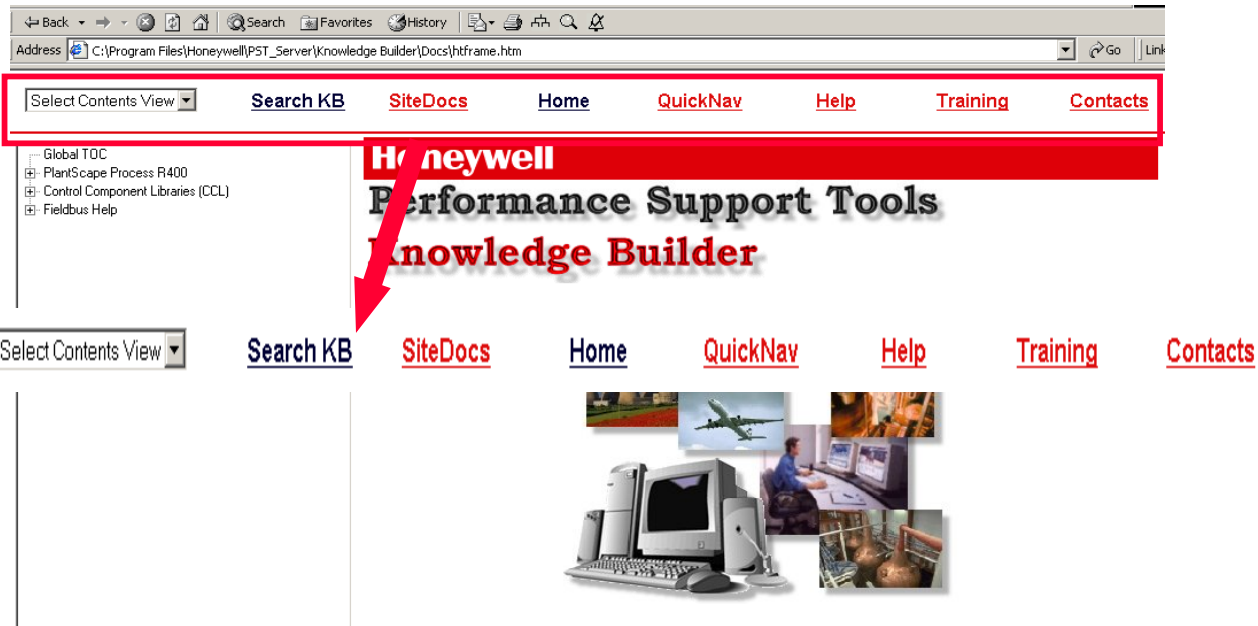

- Browser Window
- Standard Targets Window

## Using the Main Menu

### Standard Targets window

- always visible, this window provides access to KB specific navigation tools

1 - 6

## Notes

**Using the Standard Targets**

<u>Standard Target</u>	<u>Function</u>
<b>Search KB</b>	- opens the Knowledge Builder search function, which allows users to search for key words throughout the online documents and Site Docs.
<b>SiteDocs</b>	- a purchasable feature of Knowledge Builder that allows users to access and view their own files through the Knowledge Builder browser. SiteDocs also allows for Administrative controls including the monitoring of Users' history. A limited version of SiteDocs is provided with Knowledge Builder for evaluation purposes.
<b>Home</b>	- opens the main page of Knowledge Builder, giving the user access to the online documents grouped by job function, as well as access to the Feedback system.

Select Contents View ▾[Search KB](#)[SiteDocs](#)[Home](#)[QuickNav](#)[Help](#)[Training](#)[Contacts](#)

1 - 7

**Notes**

**Using the Standard targets ... continued**

<u>Standard Target</u>	<u>Function</u>
<b>QuickNav</b>	- takes you to details of either Function Blocks, or of all hardware pertaining to PlantScape including the C200 and its IO modules as well as all non-hybrid controllers.
<b>Help</b>	- opens the online documentation about Knowledge Builder's functions and features.
<b>Training</b>	- provides to the Automation College web page
<b>Contacts</b>	- lists the sales and service telephone numbers of regional Honeywell offices in the United States and Canada.

1 - 8

**Notes**

## Information window

- displays all Knowledge Builder information

1 - 10

## Notes

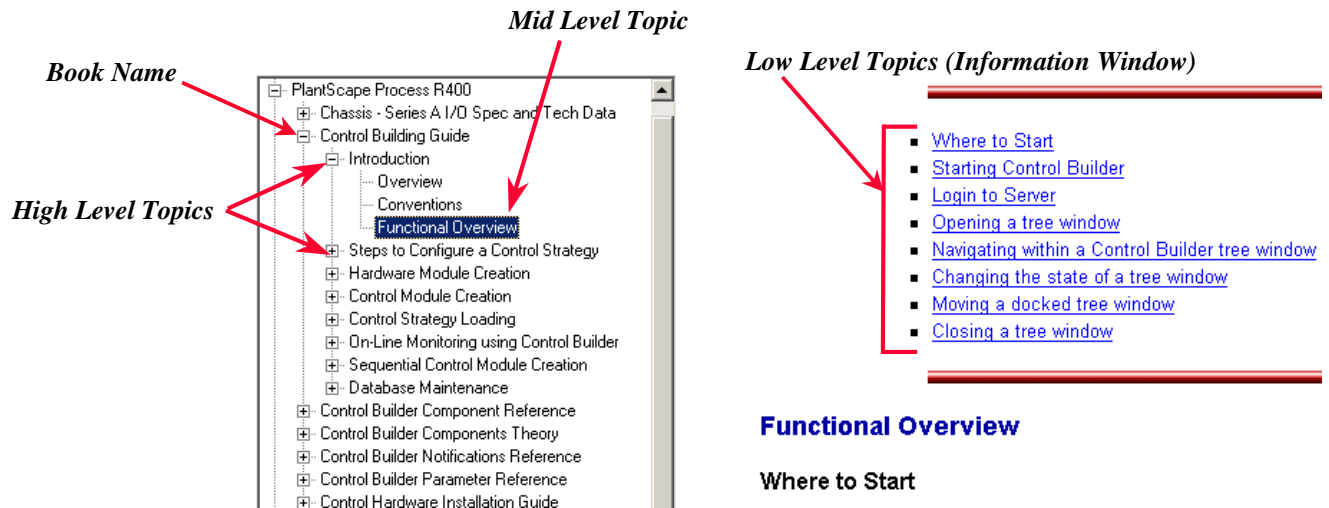

This image shows a blank sheet of white paper with horizontal ruling lines. The lines are evenly spaced and extend across the width of the page. There is a vertical margin line on the left side, creating a narrow left margin. The paper appears to be from a notebook or a standard ruled document.

## Accessing Information

### Global Table of Contents

- The Global Table of Contents contains a list of all available information components.

1 - 11

### Notes

Navigating within an Information Component

Global Table of Contents . . . continued

Topic Level	Definition and Functionality
High-Level Topics	<b>High Level Topics</b> include the document's name and its first heading level. High-level topics are not selectable and serve only to structure mid- and lower-level topics in the table of contents.
Mid-Level Topics	A <b>Mid-Level Topic</b> is the second heading level within a document. A separate page exists in Knowledge Builder for each mid-level topic. This page may contain multiple lower-level topics. A mid-level topic is selectable from the tree-view table of contents by clicking that topic with the mouse.
Low-Level Topics	A <b>Low-Level Topic</b> is the heading list at the top of each Knowledge Builder page. The list contains hyperlinks which, when clicked, take you to the heading's location on that page.

Controller and Point Server References

Operations

This category is designed with the intent of providing grouped information for use by system Operators. The Operations category has a complete listing of all documents contained within Knowledge Builder, that contain operator related information. This can be everything from software operation to the operation of specific hardware.

When to use this Category:

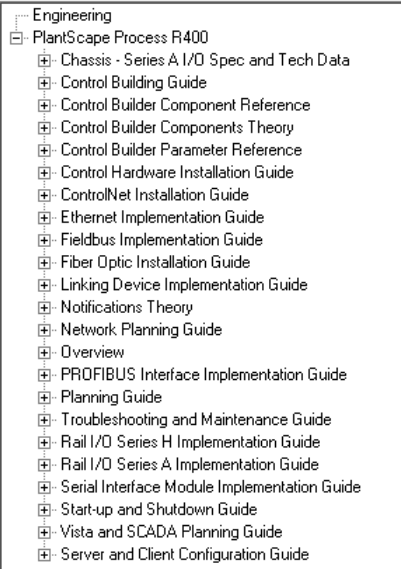

- When questions arise during operation (How do I resolve an alarm?)
- For specific operator tasks (Configuring a Trend)

Notes

## Accessing by Job Function . . . *continued*

- **Example 2**
  - Clicking on the **Engineering** Button will display a different list of information components based on the needs of this job function

## Engineering

This category is designed with the intent of providing grouped information for Engineering related tasks. The Engineering category has a complete listing of all documents that an Engineer would use to implement and configure a system.

When to use this Category:

- When planning to implement new features in you existing system
- When designing a new system architecture

1 - 16

## Notes

Accessing by Information Type

- Information components are grouped according to the following information types

Information Type	Definition	Examples
Guides	“How to” procedures	<ul style="list-style-type: none"><li>Control Building Guide</li><li>ControlNet Installation Guide</li></ul>
Reference	“Look Up Data” not normally read cover to cover	<ul style="list-style-type: none"><li>Control Builder Parameter Reference</li><li>Control Specifications Reference</li></ul>
Theory	“How it works” theory of operation	<ul style="list-style-type: none"><li>Control Builder Components Theory</li><li>Notifications Theory</li></ul>

Notes

## Searching Knowledge Builder

### Search Function from Knowledge Builder

- From Knowledge Builder, click the **Search KB** toolbar target. The Knowledge Builder Search user interface appears:

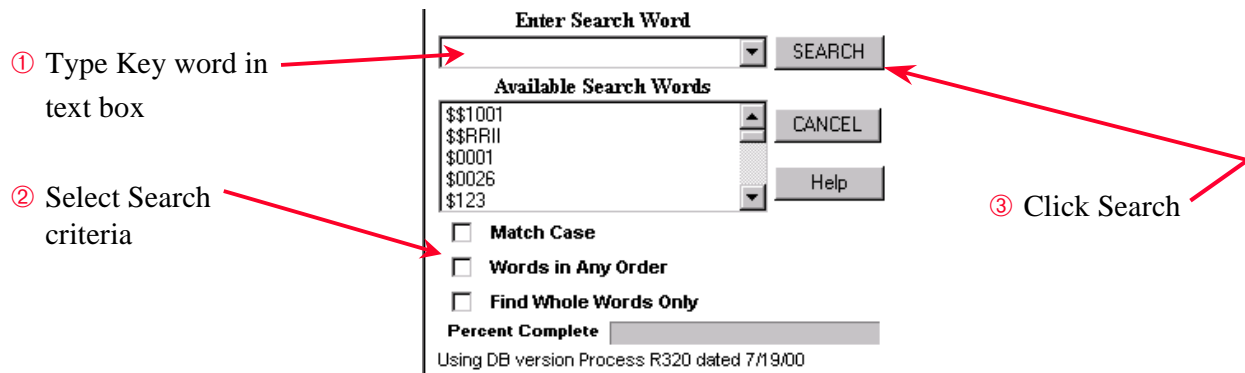

1 - 20

## Notes

**Honeywell**

## Searching the PlantScape Knowledge Builder ...continued

### Using the Knowledge Builder Search User Interface

- The result is a tree view selection list of all references to the search key word

1 - 21

## Notes

Step	Action
1	Type in text you wish to search for or select (double-click) keyword(s) from the list (Can be up to three individual words)
2	Select search criteria <b>Match Case</b> - locates matches with same case (upper or lower case) as entered text. <b>Words in Any Order</b> - locates words in any order within a low level topic. For example, if you search for system security using this criteria, search results will include matches such as “system level security” and “security of the system”. <b>Find Whole Words Only</b> - locates whole word matches of entered text (that is, matches that are not part of another word).
3	Click Search. Matches will display in the Knowledge Builder Global Access Window sorted by document.
4	Click a topic in the match list to display in the main browser window.

## Searching the PlantScape Knowledge Builder ...continued

### Using the Knowledge Builder Search User Interface

- Click a topic as desired.
- The selected topic displays in the information window.
- The word or phrase searched for will appear in red

**Enter Search Word**

 PULSECOUNT Block  
 PULSECOUNT Block  
 PULSELENGTH Block  
 Controller References  
 Hardware Point Building Guide

**PULSECOUNT Block**  
**Description**  
 The PULSECOUNT block generates pulses according to its pulse count **control algorithm**. The pulsed outputs are usually fed to Digital Output Channel blocks.  
 The PULSECOUNT block requires a pulse time parameter and a user configurable pulse output period as its inputs. The digital outputs are pulsed in relation to the configured period and the pulse time that is requested. It looks like this graphically and it is only available in release R200 or greater.

Diagram showing PULSECOUNT block inputs and outputs:  
 PULSETIME (input)  
 LOCALMIN (input)  
 OFF (input)  
 PDELAYDIRCHG (input)  
 PPERIOD (input)  
 0.01 (input)  
 PORAISE (output)  
 OFF (output)  
 FOLLOWER (output)  
 OFF (output)  
 PO (output)  
 PEE (output)

1 - 22

**Notes**

### Knowledge Builder Search Tips

1. For some searches the number of hits is so large that you need to refine the search using different search words or phrases, and using the search criteria choices.
2. The match results will always display the high level topic. Scroll through the topic to locate the specific matched item.
3. Always select Match Case and Find Whole Words Only when looking for instances of logical expression of function block names such as "AND".

## Printing Topics in the PlantScape Knowledge Builder

### Using the Browser Print button

- Select the window you wish to print
- Click the **Print** button.

### Using the File Print command

- Select the window you wish to print
- Click **File -> Print**
- Select desired printing options.
- Click **OK** in the Print window

### Using the right mouse button

- Right-click in the window you wish to print
- Click **Print**
- Select the frame type you want to print  
(As laid out on screen, Only the selected frame, All frames individually)
- Click the **OK** button

1 - 23

**Navigating Knowledge Builder**

1 - 24

**Notes**

---

---

**Honeywell**

# **PlantScape Controller Implementation**

## **Lesson 2**

### **Using Control Builder**

---

1 - 25

---

#### **Notes**

#### **Introduction**

The purpose of this Lesson is to give you the knowledge to be able to open and operate Control Builder. After you complete this Lesson you should be able to identify the procedures to operate Control Builder.

#### **Objectives**

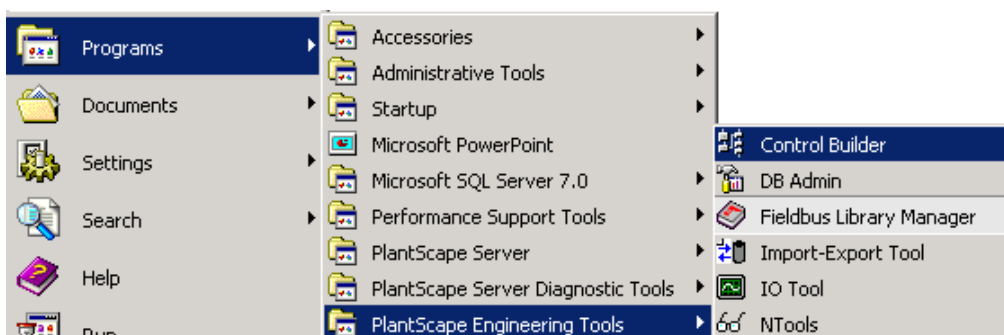

- ❶ Identify the tab used to make structural changes to an existing Control Module.
- ❷ Identify the tab used to change parameters on line
- ❸ Given a statement on backing up your controller data base, identify whether the statement is correct.

## Starting Control Builder

### From the Windows NT Taskbar

- From the lower-left corner of your Windows NT desktop, click
  - **Start**
    - **Programs**
      - **PlantScape Engineering Tools**
        - **Control Builder**

1 - 26

## Notes

### Control Builder From Desktop

Control Builder can be accessed from the desktop from PlantScape Engineering Tools

## Logging onto Control Builder

### Logon Procedure

- Input your ID, password and target Server in the dialog box

- Upon successful logon, your access level appears in the lower right corner of Control Builder

1 - 27

### Notes

#### Logon procedure

Since R300, Control Builder requires the user to logon. The logon profile that Control Builder uses is that of the Operator profile in PlantScape server.

The profile contains the access level of the user, i.e., Lvl1, Lvl2, Oper, Supv, Engr, or Mngr. Lvl1 and 2 are view only, Oper and Supv allow operations, and Engr and Mngr allow configuration.

If you do not have an Operator profile, Control Builder opens at Lvl1 access.

## Using the Toolbar

### Toolbar

- Not all of the toolbar features will be available until Control Builder items have been opened

1 - 28

## Notes

### Toolbar

The toolbar gives you a graphical easy-to-use interface for accessing the different tools available from Control Builder. The tools can also be found by accessing the dropdown menus.

## Opening and Using Tree Views

### Opening Tree Views

- Clicking on the open tree window button will open the first area on the left side of your screen

1 - 30

## Notes

### Opening Tree Views

Clicking on the File drop down menu then selecting Open Tree Window will also open the tree view in the drawing area. An additional tree window display may be opened by clicking on the open tree window button a second time. This will permit you to have two views displayed at the same time.

The default for Control Builder is two tree views open on the left border of the main window.

### Using Tree Views

- Once the tree view is open you will have a choice of 3 selection tabs
  - **Project** Displays your CPM, IOMs, CMs and SCMs in the current project
  - **Monitoring** Displays all objects that have been loaded to the Process Control Module (CPM)  
Permits active modules to be viewed during process
  - **Library** Displays all available Function Blocks grouped into type categories

1 - 31

## Notes

### Project Tab Functionality

- Create new CMs and SCMs
- Define parameter configurations for CMs and SCMs
- Wire components of CMs and SCMs together
- Configure CM and SCM alarms
- Assign CMs and SCMs to CEE
- Open and Edit existing CMs and SCMs
- Save changes
- Load CMs and SCMs to the CPM

### Monitoring Tab Functionality

- Open CMs and SCMs for online monitoring
- Activate / Deactivate CMs and SCMs
- Update changes to a project file
- Change controller parameters and upload to the Engineering Repository (ER)
- Change monitoring / configuration parameters on the faceplate of CM blocks

All structural changes to the database must be made in the Project view. Once all changes are complete they must then be reloaded and reactivated

## Creating New Devices

### Creating From the List

- From the Upper-Left corner of your Windows NT desktop, click
  - **File**
    - **New**
- From here you will have a choice of
  - **Controllers**
  - **Redundancy Module**
  - **I/O Modules**
  - **Interface Modules**
  - **Control Module**
  - **Sequential Control Module**
  - **Wizard ...**

1 - 32

## Notes

## Honeywell

### From the Library Tab

Select the **Library** tab from the tree view to display a list of devices

- **SYSTEM**
  - Control Module
  - SCM
- **IOMODULE**
  - (All available I/O Modules)

1 - 33

**Honeywell**

# **PlantScape Controller Implementation**

## **Lesson 3**

### **Configuring Your Server**

1 - 35

#### **Notes**

#### **Introduction**

The purpose of this Lesson is to prepare you to be able to verify that the PlantScape server is configured properly. After you complete this Lesson you should be able to identify the procedures to verify ControlNet communication software and to verify server ControlNet and IP addresses.

#### **Objectives**

- ❶ Gain knowledge required to verify Control Net driver configuration in RSLinx
- ❷ Gain knowledge required to verify the server's Ethernet configuration and IP addresses
- ❸ For this class, configure a Station and an Operator profile on the server connected to the controller, along with the appropriate Hosts file to log efficiently into that server

**Honeywell**

## Verifying ControlNet Communication Software & Server Address

### Open RSLinx

From the lower-left corner of your Windows NT 4.0 Desktop, click

- **Start**
  - **Programs**
    - **Rockwell Software**
      - **RSLinx**
        - **RSLinx**

### Verifying ControlNet communication software

- From the Communications Menu, click **Configure Drivers**

1 - 36

## Notes

### Before you begin

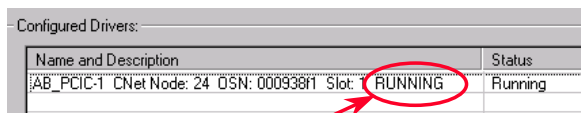

After successfully logging on to your Server for the first time, make sure that your Server has a valid ControlNet address. The Server uses ControlNet to communicate with the PlantScape Hybrid Controller. Each device (i.e., controller, server, or I/O rack) on a particular ControlNet must have a unique address.

Be sure that your communication software is configured correctly. RSLinx software (which is installed as a part of PlantScape server) is used to select and configure the proper driver for the server's PCIC card and to set the server's CNet address.

## Honeywell

### Verifying ControlNet communication software ...continued

- In the listing of Configured Drivers, locate the line starting with **AB\_PCIC-1 CNet...** \*

Name and Description	Status
AB_PCIC-1 CNet Node: 24 OSN: 000938f1 Slot: <b>RUNNING</b>	Running

- Status column should say “Running”.

#### If it...

reads “**RUNNING**”...

does not read “**RUNNING**”...

#### Then...

your RSLinx communication software has been configured correctly on your system.

you may have a problem requiring assistance from Honeywell’s Technical Assistance Center (TAC).

**Note:** If the status is not “**RUNNING**” in class, check with your course manager.

1 - 37

## Notes

### Verifying ControlNet communication software

\* This section of the module (pages 1-37 through 1-39) assumes a connection from the Server to the C200 through Control Net. If you are using Ethernet to connect, you will see a different driver in the window. Check with your course manager for other differences.

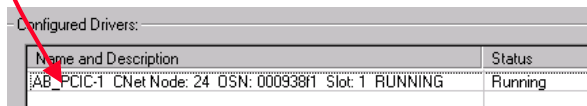

During this Unit, do NOT save any changes unless requested to do so.

**Honeywell**

### Verifying ControlNet server address

- From the Configured Drivers Window, double-click the line that starts “PCIC CNet...”

Name and Description	Status
AB_PCIC-1 CNet Node: 24 OSN: 000938F1 Slot: 1 RUNNING	Running

- Observe the Net Address

#### If...

it is set to **24**

it is not ...

#### Then...

your RSLinx communication software has been configured correctly on your system.

you may have a problem requiring assistance from Honeywell's Technical Assistance Center (TAC)

1 - 38

## Notes

### Verifying ControlNet server address

A ControlNet address is also referred to as a Net Address.

CNet address 1 is the “keeper” of the CNet communication configuration settings. This address and configuration must be assigned to a Hybrid controller. Setting the controller address will be covered later in the course.

**Verifying ControlNet server address ...continued**

- From the data displayed on your screen, record the:

– **Net Address** \_\_\_\_\_

Reminder - in the following steps do not save any changes if prompted to do so.

- Click **OK** to close the **Configure 1784- PCIC Device** screen
- Click **Close** to close the **Configure Drivers** screen
- From File Menu, click **Exit** to close the **Rockwell Software RS Linx** screen.

1 - 39

**Notes**

## Honeywell

### Verifying adapter and IP address

- From the lower-left corner of your Windows NT 4.0 Desktop, click:
  - **Start**
    - **Settings**
      - **Control Panel**
- Double-click the **Network** Icon to access the Network screen.

1 - 40

## Notes

### Background

The PlantScape Server uses Ethernet hardware and the TCP/IP protocol to communicate with remote user stations. Even if your system does not have a remote user station, an adapter must be installed and a TCP/IP Address must be configured before PlantScape points can be built.

If your Server doesn't have an Ethernet card installed, your system can be configured to use a Loopback Adapter, This is software that causes the Server to act like an Ethernet card is installed. If your Server must communicate with other computers, you will need a real adapter.

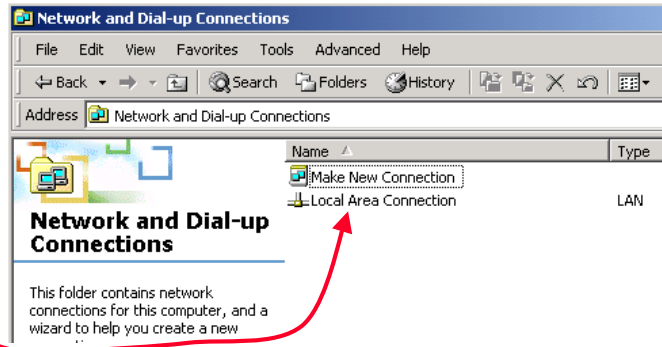

If your system (server and remote stations) will be attached to an existing network, for example your company's LAN, you must get permission from the Network Administrator who controls the other network. The Network Administrator will be able to tell you what IP Addresses to use.

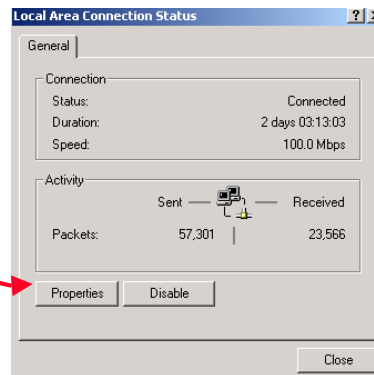

**Verifying adapter and IP address ...continued**

- Double click the **Local Area Connection**

- Click the Properties button

1 - 41

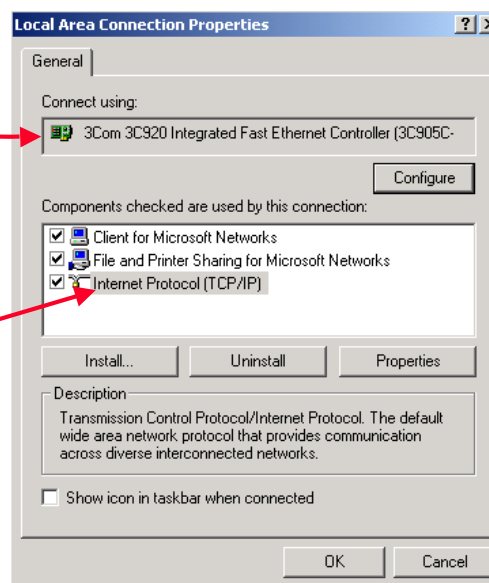

**Notes**

### Verifying adapter and IP address ...continued

- Observe the displayed network adapter

- Double click Internet Protocol (TCP/IP)

1 - 42

## Notes

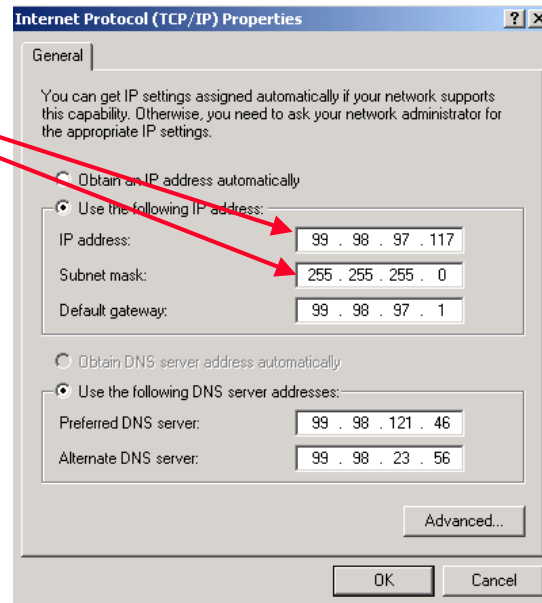

### Verifying adapter

If your system will include remote user stations, or if your Server will need to communicate with other computers over an Ethernet network, you must have a configured physical Ethernet adapter. If you purchased an Ethernet adapter from Honeywell at the same time as you ordered your Server, your adapter should be configured for you. If you plan to purchase the Ethernet adapter later, or if you order it from someone other than Honeywell, you will need to configure the adapter yourself.

**Verifying adapter and IP address ...continued**

- Note your IP address and Subnet mask

1 - 43

**Notes**

---

---

---

---

---

---

---

---

---

---

### Verifying adapter and IP address ...continued

- Record the Ethernet **IP Address** and **Subnet Mask** of your **assigned** server. You will need this information when you connect other computers. (Next page)

– Ethernet IP Address      \_\_\_\_ . \_\_\_\_ . \_\_\_\_ . \_\_\_\_  
– Subnet Mask                \_\_\_\_ . \_\_\_\_ . \_\_\_\_ . \_\_\_\_

### Closing the network configuration tools

Reminder - in the following steps **DO NOT** save any changes if prompted to do so.

- Click **Cancel** to close the **Internet Protocol (TCP/IP) Properties** window.
- Click **Cancel** to close the **Local Area Connection Properties** window.
- Click **Close** to close the **Local Area Connection Status** window
- Click the upper right  button to close the **Network and Dial-up Connections** screen

1 - 44

### Notes

### Configuration For Class -- Starting PlantScape Services, Adding Stations and Operator Profiles

- **Configure Hosts File**
  - Open \Winnt\system32\drivers\etc\Hosts in Notepad
  - Add an entry for the server, the PC that is connected through Control Net cable\* to your assigned C200 controller (Localhost is already included. If you are sitting at the server no edit is required.)
- **Start PlantScape Services**
  - On the server referenced above, click **Start → Programs → Administrative → Tools → Services**
  - Scroll down to eight PlantScape services and change seven **Startup Type** properties from **Disabled** to **Automatic**, change **PlantScape Server Logger** to **Manual**.
  - Reboot the server
  - Allow about one minute after bootup and verify the PlantScape services are running

1 - 45

### Notes

\*If you are connected through Ethernet to the C200, verify with your course manager the server IP address.

---

---

---

---

---

---

---

---

## Honeywell

### Configuration For Class -- Adding Stations and Operator Profiles (*Continued*)

- **Share the Honeywell directory**
  - On the server referenced above, share the **Honeywell** directory using share name  
**Honeywel**  
Note: The folder **TPS50** is shared under the name **Hybrid** by default, which allows remote Control Building. The above share allows access to the folders **client** and **server**.
- **Configure Stations for use in Class**
  - Open Quick Builder using Existing Project:  
**Honeywell\client\qckbld\training\_400\_srv1.qdb**
  - Configure the project to load to the server connected to the C200  
(Same server referenced in previous class configuration steps)
  - Configure Station # for a one second update rate (One second is the default update for Static Stations; Five seconds is the rate for Rotary.) \*
  - Download Station # -- **Do not load the entire project!**

1 - 46

## Notes

### \* Station #

From this point onward, the # sign will designate your team number. See your course manager for details

### Configuration For Class -- Adding Stations and Operator Profiles *(Continued)*

- **Configure Operator Profile**

- Connect your Station to the server to which you loaded in the previous step. Use station number #
- Use password **mngr** to acquire manager level access
- Configure operator number **2#** for **manager** access level\*
- Assign Areas **S1** (System Area) and **A#** to your station

\*Note: **Remember this ID and Password!** This profile is required for Control Builder read/write access login.

1 - 47

## Unit 1 Exam

QuesNo	Question
1	Knowledge Builder can be accessed from:  A Station Help. B Control Builder Help C Windows Desk Top. D All of the above.
2	Which of the following is the best definition for a Knowledge Builder Guide?  A A Knowledge Builder guide is a collection of general purpose information. B A Knowledge Builder guide is a "look it up" manual, not to be read cover to cover. C A Knowledge Builder guide contains "how it works" information. D A Knowledge Builder guide is a collection of "how to" procedures.
3	Which of the following is the best definition for a Knowledge Builder Theory Manual?  A A Knowledge Builder Theory Manual is a collection of general purpose information. B A Knowledge Builder Theory Manual is a "look it up" manual, not to be read cover to cover. C A Knowledge Builder Theory Manual contains "how it works" information. D A Knowledge Builder Theory Manual is a collection of "how to" procedures.

- 
- 4 Which of the following is the best definition for a Knowledge Builder Reference Manual?
- A A Knowledge Builder Reference Manual is a collection of general purpose information.
  - B A Knowledge Builder Reference Manual is a "look it up" manual, not to be read cover to cover.
  - C A Knowledge Builder Reference Manual contains "how it works" information.
  - D A Knowledge Builder Reference Manual is a collection of "how to" procedures.
- 5 In Control Builder, to add a Control Module or make structural changes to an existing CM you must use the:
- A Project tab
  - B Monitoring tab
  - C Library tab
- 6 In Control Builder, to view CMs on line or to change parameters on line, you must use the:
- A Project tab
  - B Monitoring tab
  - C Library tab
- 7 To back up your controller data base, you must first ***upload*** to the Monitoring tab, then ***update*** to the Project tab.
- A True
  - B False

- 
- 8 From the RSLinx communication software menu you can select "Configure Drivers" to display a list of the currently configured drivers. What does it mean when the driver, AB\_PCIC-1 Cnet..., indicates Running... ?
- A You should call the Honeywell Technical Assistance Center (TAC).
  - B You need to access the device from the Windows NT Control Panel and disable the driver.
  - C You need to remove the server's ControlNet ISA Interface card and reset its jumpers according to the procedures defined in the Control Hardware Installation Guide.
  - D Your RSLinx communication software has been configured correctly on your system. Running is the expected response indicating the driver is operational.
- 9 To verify the CNet server address, from the RSLinx Communications Menu, click Configure Drivers and in the listing of Configured Drivers, double-click the line starting with "AB\_PCIC-1 CNet..." and observe the MAC ID.
- A True
  - B False

# **Unit 2**

## **Use and Configuration Of PlantScape Hardware**

---

**Honeywell**

---

# **PlantScape Controller Implementation**

## **Lesson 2**

### **Configuring a Control Processor Module (CPM)**

---

2 - 11

---

#### **Notes**

#### **Introduction**

The purpose of this Lesson is to familiarize you with the method of configuring Control Processor Modules (C200) in the PlantScape system. After completing this Lesson you should be able to configure a CPM for non redundant use.

#### **Objectives**

- ❶ Configure a CPM with the proper settings in Control Builder

**NOTE: The hardware configuration labs must be done as a team since there is one controller per student team. From this point onward the # sign is to be replaced with the student team number.**

**Honeywell**

## Creating a Controller

### Creating a non-redundant CPM and CEE

- Click
  - **File**
    - **New**
      - **Controllers**
        - **CPM200 - Control Processor Module...** to open the configuration form shown on the next page.

2 - 12

## Notes

### Adding to the Project

The above method of adding a controller to the Project can be used for all other components of the Project as well. In the next lab, we will use this method to add I/O modules.

**Note:** All Control Builder sessions will log into the server connected to your assigned C200 controller. Sign into Control Builder using the Operator ID and Password you created in the Server Configuration lab.

Honeywell

## Creating a Controller

### Creating a non-redundant CPM and CEE

- Enter the **Name** of the controller. Suggestion: **CPM0101**, for address1, CPU slot location 1.
- Accept the Network type default ControlNet.\* Select the driver name you configured earlier in RSLinx.
- Enter the **Supervisory MAC Address** of the CNI card that is connected to the server CNet \*\*
- Enter the **CPM Slot Number** (the left-most slot number of the two CPM slots. See notes on the next page for slot numbering information)
- Enter the **Name** of the Control Execution Environment. Suggestion: **CEE0101**, for address1, CPU slot location 1.
- Enter the **Supervisory Slot Number**: the slot number of the CNI card that is connected to the server CNet

2 - 13

## Notes

### Creating a CPM and a CEE

The Control Execution Environment (CEE) supports the execution of a set of function blocks for solving control applications. It runs in the Hybrid Controller's CPM (Control Processor Module) as a software layer built on top of the control software infrastructure.

In configuration for a CNet connection, you enter the CPM Slot Number, the Supervisory MAC Address, and the Slot Number of the CNI module connected to the Server CNet. The names used for the CPM and CEE often reflect the controller MAC Address and CPM slot number.

\* If you are using Ethernet, select that option. Check with your course manager for other differences.

\*\* MAC Address does not apply to Ethernet.

## Honeywell

### Creating a Controller

#### Creating a non-redundant CPM and CEE

- Enter the **Name** of the Control Execution Environment. Suggestion: **CEE0101**, for address 01, CPU slot location 01.

CEE

Name: CEE107

Command: IDLE

Status: IDLE

Peer Update Rate: DEFAULT

Base Execution Period: 50MS

☐ This controller is redundant

Secondary CPM:

Redundancy Capability: OFF

Synchronization State: NOTINSYNC

- Note: To configure the C200 controller for **redundancy** you would use the same procedure with these exceptions: 1) The “This Controller is redundant” box would be checked; 2) The Secondary CPM name would be entered; 3) Two Redundancy Modules would be added and configured.

2 - 14

### Notes

**For CPM Slot Number** — Slots in a PlantScape rack are numbered from left to right starting with Slot 0. Count from left to right (excluding the power supply) until you get to the first slot that the CPM occupies. This should be an odd number. (Hint: most CPMs are installed in Slot pair 1 and 2.) Enter left-most slot number of the pair into the **CPM Slot Number** area of the “New Controller” window.

**For Supervisory MAC Address** — The up-link ControlNet Interface card (CNI) for the controller rack should be placed in slot 0. Determine its ControlNet MAC address by reading its front-panel display (the MAC address will have the format **A#xx**, where **xx** is the MAC address). Enter the address in “**Uplink**” MAC Address combo-box.

Honeywell

## Creating a non-redundant CPM and CEE ... continued

### Server Parameters

Click the **Server Parameters** tab.

Note that the **Point Detail** and **Group Detail Pages** are already filled in. This is true for both CPMs and CEEs.

Enter **S1** (System Area) in the **Control Area** input ports

SYSTEM:CPM200 Block, CPM0101 - Parameters [Project]	
CPM/CEE Operations	Server Parameters
<b>CPM Server Parameters</b>	
Point Detail Page	ICPMA.dsp
Associated Display	
Group Detail Page	sysGrpCPM
Control Level	200
Control Area	S1
<b>CEE Server Parameters</b>	
Point Detail Page	sysDHCEEA
Associated Display	
Group Detail Page	sysGrpCEE
Control Level	200
Control Area	S1

2 - 15

## Notes

### Server Parameters tab

The **Server Parameters** tab allows inputs that are loaded only to the server. We will use the **Point Detail**, **Group Detail**, and **Control Area** ports for all Project objects in this course.

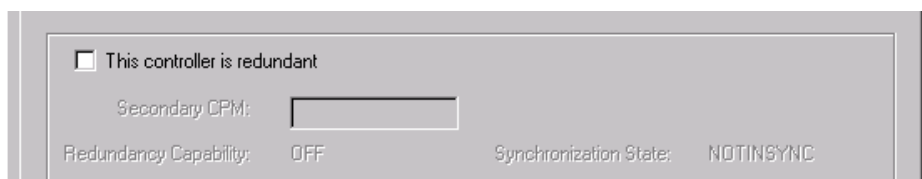

The Point and Group detail displays for CPMs, CEEs, all IOMs, and for SCMs are supplied with PlantScape software. These display names are included by default in the **Server Parameters** tab when you are configuring.

CMs are much more variable. PlantScape software provides Point and Group detail displays for a sample of CM types which you can use as is, or you can customize for your specific CMs as required. Because of the variability in CMs, the **Point** and **Group Display** ports must be filled in on their **Server Parameters** tab.

## Honeywell

### Creating a non-redundant CPM and CEE ... *continued*

- Note: To configure the C200 controller for redundancy you would use the same procedure with these exceptions: 1) The “This Controller is redundant” box would be checked; 2) The Secondary CPM name would be entered; 3) Two Redundancy Modules would be added and configured.

- Click **OK**
- Click **Project** Tab to see your newly configured CPM and CEE

2 - 16

## Notes

Notice that the CEE is under the CPM and connected directly to it. This tells you that the CEE is **assigned** to the CPM. Later, we'll see that you must assign everything that you want to download to your controller to the CEE. This includes all of your I/O modules, CMs, and SCMs.

Your **Project** tab also includes sample reference modules. These are supplied with every PlantScape database. Feel free to open and examine them.

**Honeywell**

# **PlantScape Controller Implementation**

## **Lesson 3**

### **Configuring Digital and Analog IOMs**

---

2 - 19

---

#### **Notes**

#### **Introduction**

The purpose of this Lesson is to familiarize you with the different IOMs that are available. You will learn how to configure Analog and Digital IOMs. After completing this Lesson you will be able to Configure IOMs in Control Builder.

#### **Objectives**

- ❶ Understand I/O module naming and configuration
- ❷ Understand IOM location configuration: IOM Slot Number, Remote IO Chassis MAC Address, and ControlNet Module Slot Number.
- ❸ Configure 2 Digital and 2 Analog IOMs in Control Builder
- ❹ Configure any additional IOMs as required

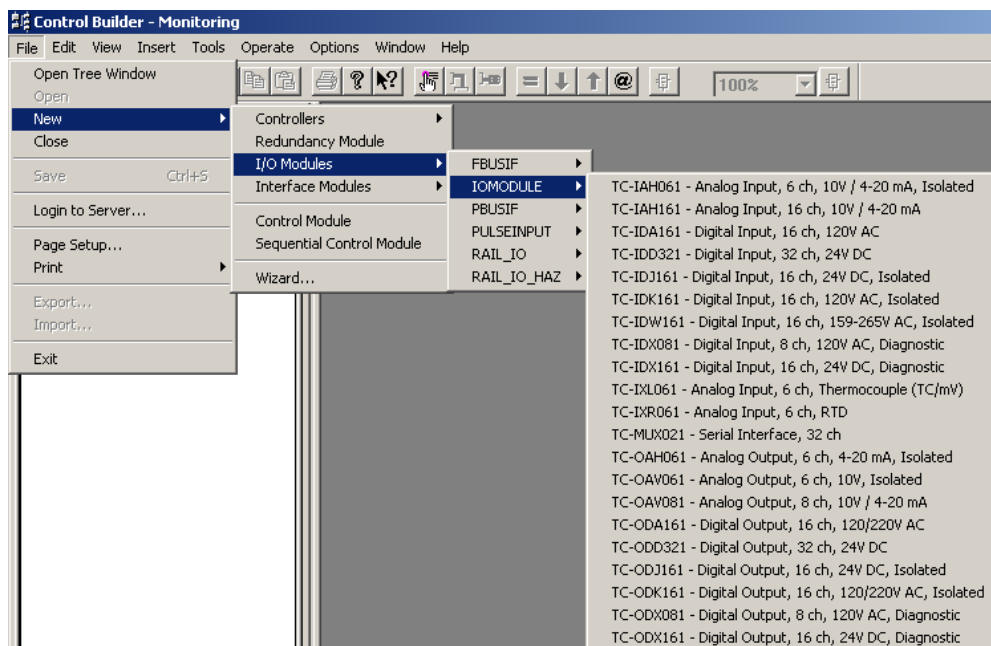

**NOTE: The hardware configuration labs must be done as a team since there is one controller per student team. From this point onward the # sign is to be replaced with the student team number.**

---

**Honeywell**

## Methods of Selecting the Proper IOM

- Menu Method

2 - 20

## Notes

IOM Function Block	Channels	Type	Rating	Isolated
TC-IDX081	8	Diagnostic Input	120 Vac	Yes
TC-IDA161	16	Digital Input	120 Vac	No
TC-IDK161	16	Digital Input	120 Vac	Yes
TC-IDD321	32	Digital Input	24 Vdc	No
TC-IDX161	16	Diagnostic Input	24 Vdc	Yes
TC-IDJ161	16	Digital Input	24 Vdc	Yes
TC-IAH061	6	Analog Input	10 V and 4 to 20 mA	Yes
TC-IAH161	16	Analog Input	10 V and 4 to 20 mA	No
TC-IDW161	16	Digital Input	220 Vac	Yes
TC-IXR061	6	RTD Input	Resistance	Yes

Continued on next page ...

## Honeywell

### Methods of Selecting the Proper IOM ... *Continued*

- Library Method

2 - 21

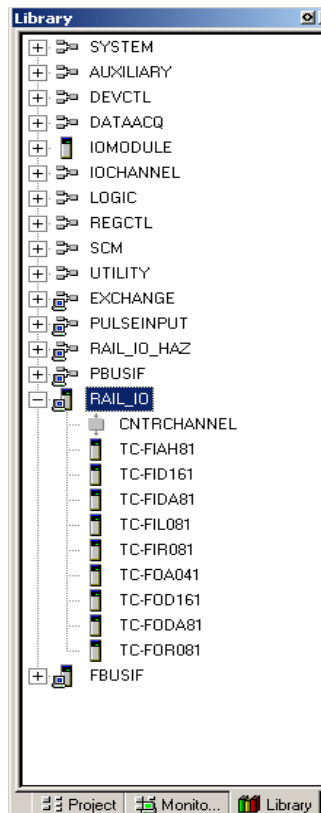

### Notes

IOM Function Block	Channels	Type	Rating	Isolated
TC-IXL061	6	Thermocouple In	Low Level mV	No
TC-ODX081	8	Diagnostic Output	120 Vac	Yes
TC-ODA161	16	Digital Output	120/220 Vac	No

TC-ODD321	32	Digital Output	24 Vdc	No
TC-ODJ161	16	Digital Output	24 Vdc	Yes
TC-OAH061	6	Analog Output	4 to 20 mA	Yes
TC-OAV061	6	Analog Output	10 V	Yes
TC-OAV081	8	Analog Output	10 V and 4 to 20 mA	No
TC-MUX021	32	Serial Interface Module		

**Honeywell**

## Methods of Selecting the Proper IOM ...*Continued*

- Library Method, continued

2 - 22

## Notes

IOM Function Block	Channels	Type	Rating	Isolated
TC-MDP081	8	Pulse Input	5 to 24 V	Yes
TC-PIA081	8	Analog Input	Haz. 1	Yes*
TC-POA081	8	Analog Output	Haz. 1	Yes*
TC-PIB161	16	Digital Input	Haz. 1	Yes*
TC-POB041	4	Digital Output	Haz. 1	Yes*
TC-PIL081	8	Temp. Input	Haz. 1	Yes*

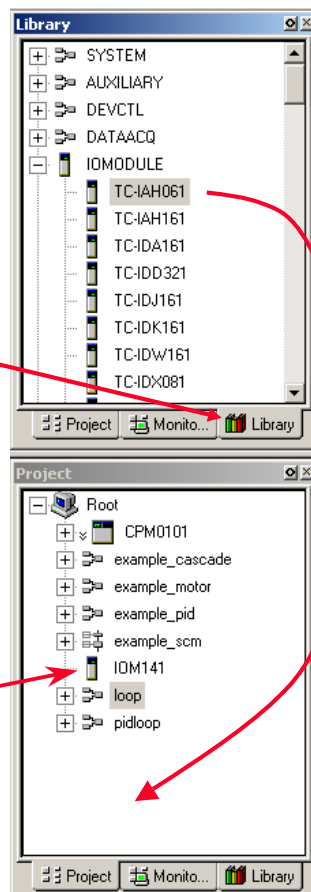

\* Galvanic isolation (per DIN EN 50 020) for input / backplane bus and input / power supply.  
 There is no galvanic isolation for the inputs relative to each other.

**Honeywell**

## Creating I/O Modules

### Creating an Analog Input Module

- Set up Control Builder so that two Tree Views are visible
- Click the **Library** tab in the upper tree view of Control Builder and expand the **IOMODULE** Library
- Drag and Drop the I/O Module **TC-IAH061** from the IOMODULE Library to the blank area at the bottom of the **Project** View
- The module appears in the Project under its default name and the dialog box shown on the next page appears

2 - 23

## Notes

### Overview

When you build your control strategy later in this training, you will need to configure the four simulator Input/Output Modules (IOMs), two input's (1 Digital, 1 Analog) and two outputs (1 Digital, 1 Analog).

- |                            |                           |
|----------------------------|---------------------------|
| • Analog Input: TC-IAH061  | Digital Input: TC-IDJ161  |
| • Analog Output: TC-OAH061 | Digital Output: TC-ODJ161 |

The number that appears after any object in Control Builder is only a reference created by the Control Library to ensure name uniqueness and has no other significance. In the example above an I/O module was created resulting in a device named IOM731. The number 731 has no significance other than a reference for Control Builder.

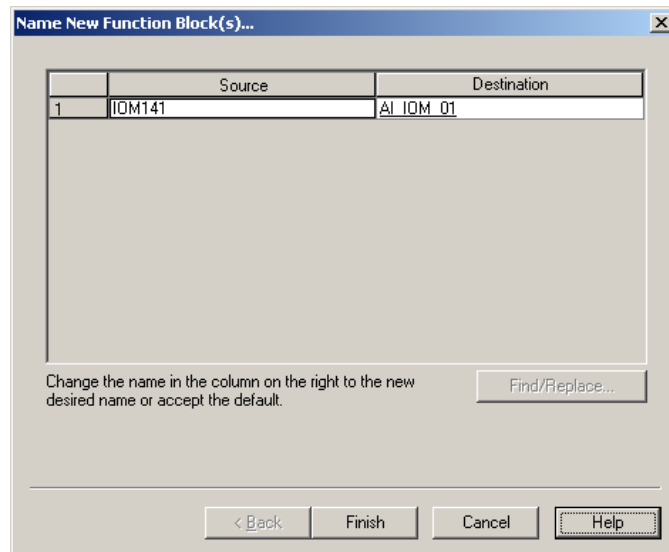

For more information on how to create an IOM, refer to *Control Building Guide, Hardware Module Creation, Creating an Instance of Input/Output Modules*.

## Honeywell

### Naming an analog input module

- Because the default name is normally changed to something more meaningful, the dialog box shown appears. It allows a name change prior to configuration
- Enter the following name in the Destination port:
  - Module Name: **AI\_IOM\_01**

- Click **Finish** and view the **Project** tab. The correct name should now appear

2 - 24

## Notes

### Naming an analog input module

The module name should reflect the type of module you are using and its location. This will make tracking easier in the future when you add more modules to your system. We have chosen **AI\_IOM\_01**. This stands for Analog Input \_ Input Output Module \_ Module Number 1.

## Honeywell

### Naming an analog input module

- Double-click **AI\_IOM\_01** in the **Project** tab to display its Parameters configuration form
- Enter the following information in the appropriate field on the **Main** tab:
  - Module Description      **Test Strategy AI Module**

IOMODULE:TC-IAH061 Block, AI\_IOM\_01 - Parameters [Project]

Main | Module Configuration | Channel Configuration | Server Parameters

Module Name: AI\_IOM\_01

Module Description: Test Strategy AI Module

I/O Module Information

Module Type: Analog Input, 6 ch, 10V / 4-20 mA, Isolated

Currently Assigned Channels:

Channel Number	Channel Name
0	
1	
2	
3	
4	
5	

IO Rack Addresses

IOM Slot Number: 0

Remote IO Chassis MAC Address: 0

ControlNet Module Slot Number (connected to IO Chassis): 0

- Next we will set up the module's address

2 - 25

### Notes

### Configuring I/O addresses ...continued

- I/O modules may reside in either controller or remote (I/O) chassis
- Three (3) addresses (fields on the modules Parameters Window) may be associated with each I/O module:
  - IOM Slot Number
  - Remote IO Chassis MAC Address
  - CNI Slot Number (connected to chassis)
- **I/O modules in a controller chassis** need the correct IOM Slot Number, but use 0 for the other address parameters

- In the **IOM Slot Number** field, enter the physical slot number of the I/O module being configured (Recall that the slot numbers start at 0.) Enter the slot for **AI\_IOM\_01**.
- Enter 0 for the **Remote IO Chassis MAC Address** and the **CNI Slot Number**.

2 - 26

## Notes

### Configuring I/O rack addresses

The I/O Rack Address is made up of three numbers that are described in the table below.

I/O Rack Addresses	Description
IOM Slot Number	Number of the slot where the IOM resides in whatever rack it is in.
Remote IO Chassis MAC Address	MAC address of the CNI card in the remote rack where the IOM resides. This is zero for local IOMs.
CNI Slot Number (connected to IO chassis)	Slot location of the CNI card in the control rack that the IO module communicates with. This is zero for local IOMs.

## Honeywell

### Configuring I/O addresses ...continued

- **I/O modules in a remote chassis** need all three fields completed.

- In the **IOM Slot Number** field, enter the physical slot number of the I/O module being configured.
- In the **Remote IO Chassis MAC Address** field, enter the MAC address of the CNI in the chassis of the IOM being configured.
- In the **CNI Slot Number** field, enter the Physical slot number of the CNI which resides in controller chassis and communicates with the I/O module.

IO Rack Addresses

IOM Slot Number  
8

Remote IO Chassis MAC Address  
5

CNI Slot Number  
(connected to IO Chassis)  
3

2 - 27

## Notes

For more information on how to configure an IOM, refer to *Control Building Guide, Hardware Module Creation, Configuring the I/O Module*.

In this course the modules are in the primary chassis therefore we will not need to specify numbers for “**Remote IO MAC Address**” and “**CNI Slot Number**”. Putting a 0 in the fields lets the system know we are only using this chassis.

### Configuring analog input module channels

- Click the **Channel Configuration** tab of the IOM Parameters configuration form
- Enter the following data on the Channel Configuration page for **Channel 0** and for **Channel 2**
  - Input Range **4mA to 20mA**
  - Notch Filter **60Hz**
  - Calibration Bias **0.0**
  - Digital Filter **0**
  - Low Engineering **0.0**
  - High Engineering **5000.0**

	Input Range	Notch Filter	Calibration Bias (f)	Digital Filter (msec)	Low Engineering (f)
0	4MA_TO_20MA	60HZ	0	0	0
1	4MA_TO_20MA	60HZ	0	0	0
2	4MA_TO_20MA	60HZ	0	0	0
3	4MA_TO_20MA	60HZ	0	0	0
4	4MA_TO_20MA	60HZ	0	0	0
5	4MA_TO_20MA	60HZ	0	0	0

- Accept the defaults for **Channels 1, 3, 4, and 5**

2 - 28

### Notes

### Configuring analog input module channels

Engineering units can be established in one of two ways: 1) in the IOM configuration; and 2) in the Data Acquisition Block of the Control Module (CM) using the input.

If you configure the low and high range in the IOM, as we do here, you will enter ranges in your (CM) that correspond to the IOM settings.

If you configure the range in the CM, you leave the IOM settings 0 and 100. You use the Characterization function in the Data Acquisition block to establish engineering units.

When configuring channels as described above, you are actually configuring only Channel 0, the first input on your AI IOM. For the other channels:

- each channel may be configured individually
- the settings for one channel may be copied to all others

## Honeywell

### Configuring Server Parameters

Click the **Server Parameters** tab.

Note that the **Point Detail** and **Group Detail Pages** are already filled in. This is true for IOMs and for SCMs. You will need to input this information for CMs.

Enter S1 (System Area) in the **Control Area** input port

C-IAH061 Block, AI_IOM_01 - Parameters [Project]	
Module Configuration   Channel Configuration   <b>Server Parameters</b>	
Server Parameters	
Point Detail Page	sysDtlAIA.dsp
Associated Display	
Group Detail Page	sysGrpAIA.dsp
Control Level	200
Control Area	S1

2 - 29

## Notes

### Server Parameters tab

The **Server Parameters** tab allows inputs that are loaded only to the server. We will use the **Point Detail**, **Group Detail**, and **Control Area** ports for all Project objects in this course.

The Point and Group detail displays for all IOMs and for SCMs are supplied with PlantScape software. These display names are included by default in the **Server Parameters** tab when you are configuring IOMs and SCMs.

CMs are much more variable. PlantScape software provides Point and Group detail displays for a sample of CM types which you can use as is, or you can customize for your specific CMs as required. Because of the variability in CMs, the Point and Group Display ports must be filled in by the configuration engineer when configuring CMs.

### Creating an Analog Output Module

- Set up Control Builder so that two Tree Views are visible
- Click the **Library** tab in the upper tree view of Control Builder and expand the IOM Library
- Click the **Project** tab in the lower tree view of Control Builder
- Drag and Drop the I/O Module **TC-OAH061** from the IOM Library to the project in the Project View
- Name the Module: **AO\_IOM\_01**

### Configuring an analog output module

- Double-click **AO\_IOM\_01** in the **Project** tab
- Enter the following information in the **Main** Tab of the Parameters Window:

– Module Description      **Test Strategy AO Module**

2 - 30

## Notes

### Creating analog output modules

The procedures and displays for creating an analog output module are very similar to those of the analog input module. Therefore, some of the details have been left out of these activities.

Refer to the preceding Naming, Configuring Addresses, and Configuring Channels topics for analog input modules if you need to review these details.

### Configuring I/O addresses

- Enter the I/O rack address information for the analog output module, including (as necessary):
  - IOM Slot Number
  - Remote IO Chassis MAC Address
  - CNI Slot Number

### Configuring analog output module channels

- Click the **Channel Configuration** tab
- Enter the following data on the Channel Configuration page, for Channels 0 and 1.
  - Calibration Bias      **0**
- Click **OK**

### Configuring Server Parameters

- Click the **Server Parameters** tab
- Enter **Control Area: S1** ; click **OK**

2 - 31

### Notes

---

## Creating a Digital Input Module

- Click
  - File → New → I / O Modules → IOMODULE → TC-IDJ161**

## Naming a digital input module

- Having used the **File > New** method to create your new I/O Module it should be open to the Main Tab
- Enter the following information:
  - Module Name **DI\_IOM\_01**
  - Module Description **Test Strategy DI Module**

2 - 32

## Notes

### Creating digital input modules

The procedures and displays for creating a digital input module are similar to those of the analog input module. Therefore, some of the details have been eliminated from these activities.

For more information on how to configure a digital input module, refer to *Control Building Guide, Hardware Module Creation, Configuring the Digital I/O Module*.

### Configuring I/O addresses

- Enter the I/O rack address information for the digital input module, including (as necessary):
  - IOM Slot Number
  - Remote IO Chassis MAC Address
  - CNI Slot Number

### Configuring digital input module channels

- Click the **Module Configuration** tab
- On this screen you will have 4 drop down selection tabs
  - **1 ms Filtering Delay** should be selected for all 4 drop down menus

	OFF -> ON	ON -> OFF
Channels 0 - 7	1MSDELAY	1MSDELAY
Channels 8 - 15	1MSDELAY	1MSDELAY

2 - 33

### Notes

**Honeywell**

**Configuring Server Parameters**

- Click the **Server Parameters** tab
- Enter **Control Area:** S1
- Click **OK**

2 - 34

### Creating a Digital Output Module

- Click
  - **File → New → I / O Modules → IOMODULE → TC-ODJ161**

TC-ODX161 - Digital Output, 16 ch, 24V DC, Diagnostic
<b>TC-ODJ161 - Digital Output, 16 ch, 24V DC, Isolated</b>
TC-ODD321 - Digital Output, 32 ch, 24V DC

### **Naming a digital output module**

- Having used the **File > New** method to create your new I/O Module it should be open to the Main Tab
- Enter the following information:
  - Module Name           **DO\_IOM\_01**
  - Module Description   **Test Strategy DO Module**

2 - 35

## **Notes**

### **Creating digital output modules**

The procedures and displays for creating a digital output module are similar to those of the analog output module. Therefore, some of the details have been eliminated from these activities. Accept the default values for parameters not detailed in the lab.

For more information on how to configure a digital output module, refer to *Control Building Guide, Hardware Module Creation, Configuring the Digital I/O Module*.

### **Configuring I/O addresses**

- Enter the I/O rack address information for a digital output module, including (as necessary):
  - IOM Slot Number
  - Remote IO Chassis MAC Address
  - CNI Slot Number

### **Configuring Server Parameters**

- Click the **Server Parameters** tab
- Enter **Control Area: S1**
- Click **OK**

2 - 36

### **Notes**

---

---

---

---

### Assigning IOMs to the CEE

- From the Control Builder Tools menu, click **Assign** to display the Controller Assignments screen
- Locate the Available Modules section on the left side of the window and Click the tab labeled IOMs
- Locate the destination CEE
  - CEE0101

#### If...

your system has multiple controllers...

you only have one controller ...

#### Then...

click the destination CEE from the window section labeled **Select CEE**.

it will be selected by default.

2 - 37

### Notes

#### Assigning IOMs and CMs to the CEE

Before you can load your IOMs to the CEE they must be Assigned.

---

---

---

---

---

---

---

## Honeywell

### Assigning IOMs to the CEE

- In the **IOMs** tab, Hold down the <CTRL> key and click on  
**AI\_IOM\_01**  
**AO\_IOM\_01**  
**DI\_IOM\_01**  
**DO\_IOM\_01**
- Select the destination CEE
- Click **Assign** in the center of the window and after a few seconds, your IOMs will appear in the section of the window labeled **Assigned Modules**
- Click **Close** and observe that your IOMs appear in the **Project** tab under and connected to your CEE

2 - 38

## Notes

Please note the following with regards to **Assigning**:

- On the toolbar you will find a purple “=” sign. This button can be use to call up the assignment menu.
- If the object you wish to assign is open for editing, the Assign function will return an error. Close the open CM drawing and repeat the Assign.

## Honeywell

### Loading the Controller, CEE, and IOMs

- In the **Project** tab in Control Builder:

- Left click on **CPM0101**

- Click the **Tools** Menu

- Click **Load With Contents** to bring up the dialog box shown on the next page

2 - 39

## Notes

### Loading

There are two commands that may be used to load objects to your CPM: **Load**, and **Load With Contents**. The Load command loads the selected objects to your CPM. The Load With Contents command loads all objects assigned to the CPM (that is, CEE, IOMs and CM).

These commands can be accessed from the **Tools** menu, or by right-clicking on the CPM or CEE.

## Honeywell

### Loading the Controller, CEE, and IOMs (*continued*)

- Verify that the items to load are checked
- Click OK
- Note that you can decide to have the modules go to the active state automatically by clicking this checkbox with the **Post Load State** selected to be **ACTIVE**

The screenshot shows the 'Load Dialog' window. It contains a table with the following data:

Load	Load List	Current State	State To Load	Post Load State
<input checked="" type="checkbox"/>	CPM0101	Not Loaded	N/A	N/A
<input checked="" type="checkbox"/>	CEE0101	Not Loaded	N/A	N/A
<input checked="" type="checkbox"/>	AI_IOM_01	Not Loaded	INACTIVE	ACTIVE
<input checked="" type="checkbox"/>	AO_IOM_01	Not Loaded	INACTIVE	ACTIVE
<input checked="" type="checkbox"/>	DI_IOM_01	Not Loaded	INACTIVE	ACTIVE
<input checked="" type="checkbox"/>	DO_IOM_01	Not Loaded	INACTIVE	ACTIVE

Below the table is a checkbox labeled 'Automatically change ALL control elements to the state selected in "Post Load State" after load is completed'. The checkbox is currently unchecked. At the bottom right are buttons for 'OK', 'Cancel', and 'Help'.

2 - 40

## Notes

### Loading

Upon selecting **Load** or **Load with Contents**, a dialog box is called up which allows you to verify (and modify) the items to be loaded. A list appears of all items to load based on your selections made prior to the load command. The check-marks in the **Load** column determine which items in the list will be loaded.

Once you click **OK**, the load begins. Time for loading is dependent on the number of objects to load.

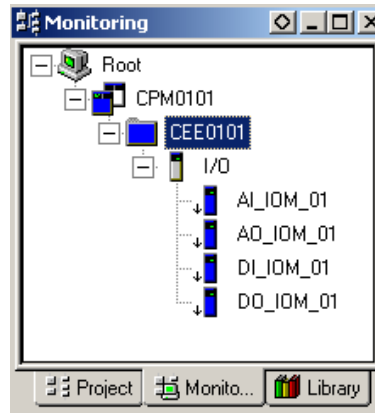

If there are any errors, a message box will appear to give you details of the problem(s). You will have a choice to continue the load; or to abort, fix the problem, and then load.

Once the load is complete, all of the loaded objects appear in the **Monitoring Tab**.

## Honeywell

### Loading ...continued

- Click **Monitoring** to go to the Monitoring tab
- In the **Monitoring** tab, click on the + signs next to **Root**, **CPM0101**, and **CEE0101** to expand the tree view

#### **Exercise\***

##### **Project vs. Monitoring**

Toggle back and forth between Project and Monitoring views and observe their contents.

What's different about them?

What do you think that means?

2 - 41

## Notes

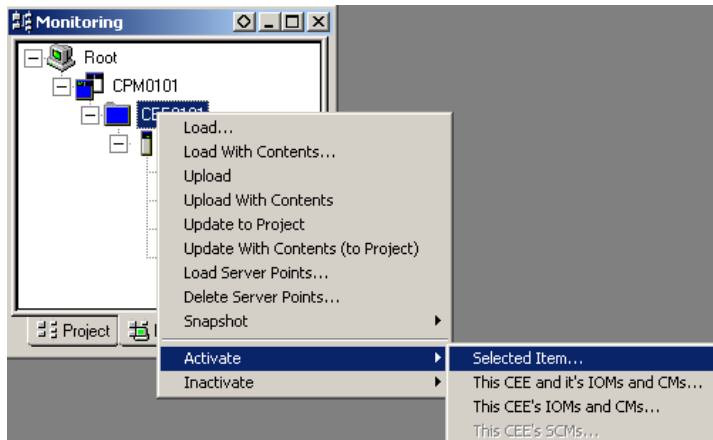

### \*Exercise

- **Green** the object is running or active
- **Blue** the object is not running, or inactive

## Honeywell

### Activating a Control Strategy

- Right-click on **CEE0101**

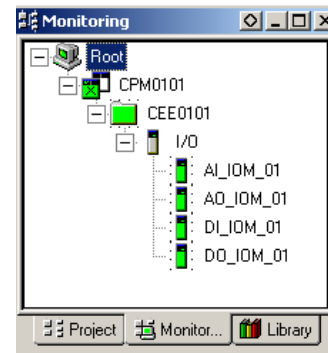

- Click **Activate** → **Selected Item**
- Click **Yes** to activate the selected item

Repeat these steps to activate your:

–IOMs

- **AI\_IOM\_01**
- **AO\_IOM\_01**
- **DI\_IOM\_01**
- **DO\_IOM\_01**

2 - 42

## Notes

### Activating a Control Strategy

There are many ways to activate loaded objects. One is to use the check box in the load dialog box to change loaded items to the post load state of ACTIVE (see Pg. 2-39). Another is to activate each item individually as we have done here. A third is to select the CEE and activate it's IOMs and CMs with one selection. A fourth is to select multiple items in the Monitor tab and click **Operate** **Activate** **Selected Items**.

**For more information about loading and activating a control strategy refer to *Control Building Guide, Control Strategy Loading*.**

Once you activate the CEE, it turns green in the **Monitoring** tab. Remember that the CEE must be active for anything assigned to the CEE to work. So, even if a CM is active, it won't do anything unless the CEE is also active.

**Monitoring Hardware from Station**

- Build Group #1 to include your controller, CEE, and IOMs

**Group Configuration**

Group #1	Hardware
Slot 1:	CPM0101
Slot 2:	CEE0101
Slot 3:	DI_IOM_01
Slot 4:	DO_IOM_01
Slot 5:	AO_IOM_01
Slot 6:	AI_IOM_01
Slot 7:	Empty
Slot 8:	Empty

- Note that you can activate the objects from Station as well as Control Builder

2 - 43

**Notes**

---

---

---

---

---

---

---

---

---

---

**Configure Additional IOMs**

- Add any additional IOMs, following the same naming convention. For example, a second DO module would be named DO\_IOM\_02.
  - See your course manager for details.

2 - 44

***Notes***

# **PlantScape Controller Implementation**

## **Lesson 4**

### **PlantScape Ntools Familiarization**

---

2 - 47

---

#### **Notes**

#### **Introduction**

The purpose of this lesson is to give you the knowledge to be able to use the Ntools to help facilitate maintenance of the the Control Net and the Hybrid Controller.

#### **Objectives**

To become familiar with some of the more frequently used features of Ntools

**Note:** Ntools can only be run on the Server. It is not available to remote Stations or remote Control Builder PCs. Please work together on your Server to view the screens.

**Honeywell**

## PlantScape Ntools Familiarization

- Start Ntools from the Run menu
  - **Start** → **Run**
- Type “Ntools -c” at the Run menu and press enter.
- Click OK to acknowledge the warning about monitoring through Control Builder.

- The screen shown will come up

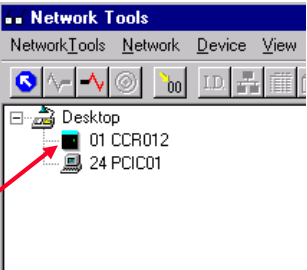

2 - 48

## Notes

## PlantScape Ntools Familiarization

- Start network scanning by selecting the Resume Icon. 
- When the Polling indicator at the bottom Network Tools screen reaches 24, stop scanning by selecting the Pause Icon 
- Single click the blue/black box in the Tree pain 
- N-tools will scan the chosen device and show a detail display of the controller in the Detail Pane as shown below. (See the next page for a description of the N-tools screen layout.)

0	1	2	3	4	5	6	7	8	9
CCR012	PRS021				IDJ161	ODJ161	QAH061	IAH061	
IDLE	RUN				O K	O K	O K	O K	
V4.22	50ms CEE				V16	V16	V19	V19	
AWD1 W	AVPS320.0-20.1								
	AVPS320.0-20.1								

2 - 49

## Notes

### Details of the controller

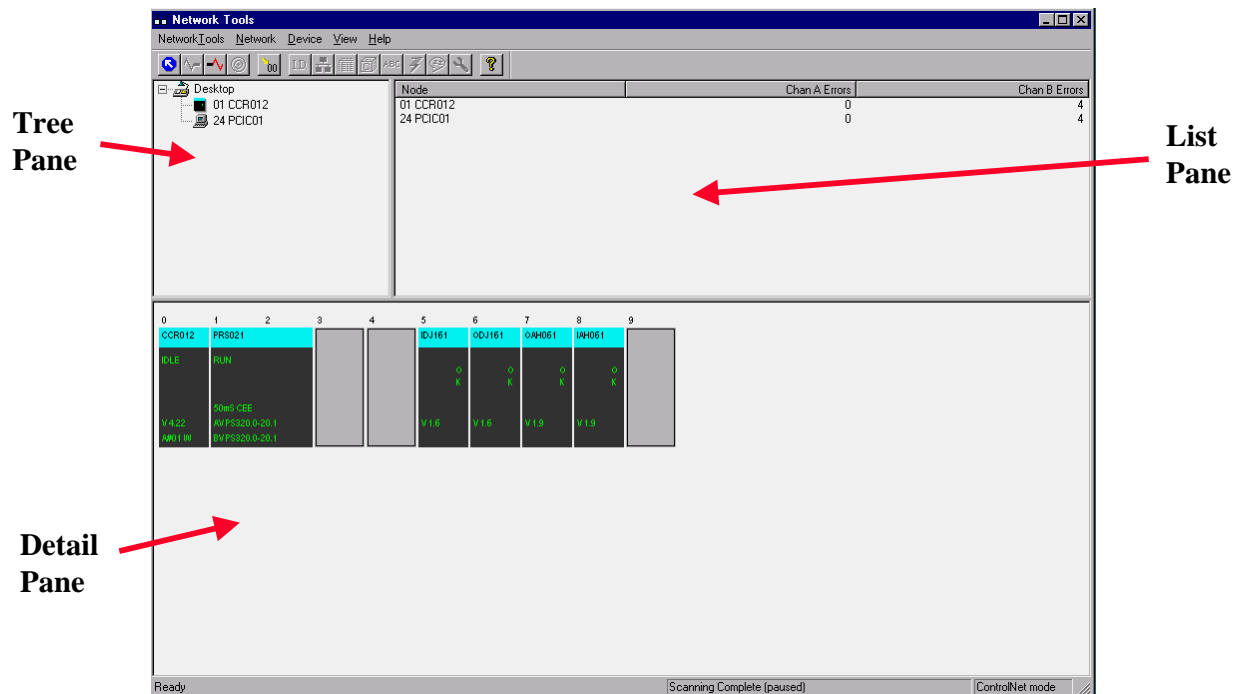

If the controller has not been previously detailed in N-tools, after clicking the icon in the tree pane, you will see a dialog box asking how many slots are in the rack. If there are any outboard racks to detail, use the provided tabs to set up the number of slots in those.

This information is needed so that the detail display shows any spare slots accurately. After the initial callup this information is stored in N-tools.

## PlantScape Ntools Familiarization

- N-tools Screen Layout

2 - 50

## Notes

### N-tools Screen Layout

N-tools is divided into three main screen regions or panes:

- Tree Pane which shows the devices in the supervisory Control Net.
- List Pane which shows Control Net performance statistics.
- Detail Pane which shows the details of the object selected from the Tree Pane.

**Honeywell**

## PlantScape Ntools Familiarization

- Select the CNI card in the Detail Pane

- A red box should now appear around the CNI card.

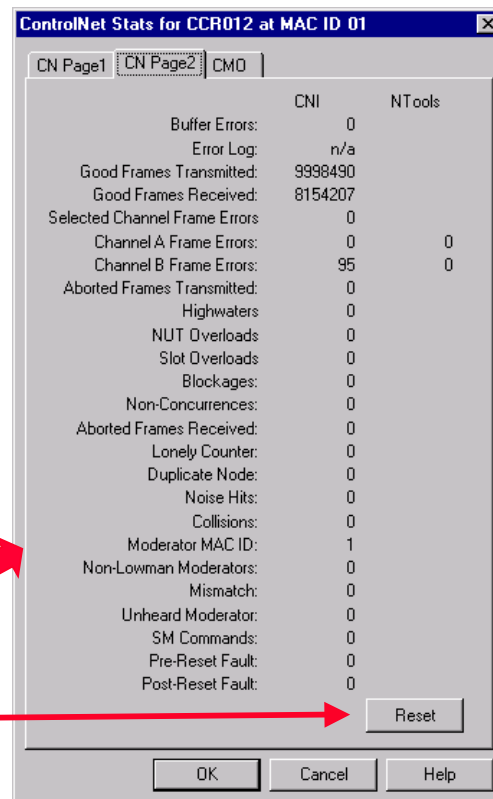

- Next select the ContrlNet Stats Icon from the tool bar 

- Then select the “CN Page2” tab

- You should now see a display similar one the at the right
- Note it is normal to see Frame Errors on channel B since in training we do not usually connect B cables.

- Select the Reset button

- All Frame Errors should now be zero

2 - 51

## Notes

### Hardware Details

Details on any module in the rack can be displayed from N-tools. The above method or a double click will display the details. The CNI has more parameters than any other module.

---

---

---

---

---

---

---

---

## PlantScape Ntools Familiarization

Select the CPU card in the Detail Pane

- Next Select the Crash Block Icon from the tool bar. 

- Accept the default file name and click save.

- You should now see a text file dump similar to the one shown 

```
CPM0101:
        BOOT FILENAME = cpmboot2

## Unit 2 Exam

QuesNo	Question
1	<p>When a C200 controller is added to the Project tab, the name it is given by Control Builder is CPMxx. The xx is an index number used in controller operation and this name must not be changed.</p> <p>A True</p> <p>B False</p>
2	<p>When counting slots from left to right beginning with zero, the CPM counts as 2 slot locations.</p> <p>A True</p> <p>B False</p>
3	<p>The hybrid controller communicates with remote I/O racks through which of the following?</p> <p>A Ethernet</p> <p>B CNet using a PCIC card</p> <p>C CNet using the supervisory CNI module</p> <p>D CNet using an additional CNI(s) dedicated to remote I/O communication</p>
4	<p>When an I/O module is added to the Project tab, the name it is given by Control Builder is IOMxx. The xx is an index number used in controller operation and this name must not be changed.</p> <p>A True</p> <p>B False</p>

- 5 In the following diagram, what are the three numbers required to configure the slot location of the designated IOM.

IO Rack Addresses	
IOM Slot Number	<input type="text" value="0"/>
Remote IO Chassis MAC Address	<input type="text" value="0"/>
ControlNet Module Slot Number (connected to IO Chassis)	<input type="text" value="0"/>

IOM Slot Number \_\_\_\_\_

Remote IO Chassis MAC Address \_\_\_\_\_

ControlNet Module Slot Number \_\_\_\_\_

# **Unit 3**

## **Introduction to Creating Control Modules**

---

**Honeywell**

# **PlantScape Controller Implementation**

## **Lesson 1**

### **Configuring a Continuous Control Strategy**

---

3 - 3

---

#### **Notes**

##### **Introduction**

The purpose of this Lesson is to give you the knowledge to be able to configure a continuous control strategy. After you complete this Lesson you should be able to identify the procedure to configure a continuous control strategy.

##### **Objectives**

- ❶ Understand the naming of new Control Modules
- ❷ Understand the naming of Function Blocks
- ❸ Configure a PID loop CM

**Honeywell**

## Creating Control Modules

### Creating and saving a module

- Set up the Control Builder with both the **Library** and **Project** views visible.
- Click and expand System under the **Library** tab so that CONTROLMODULE is in view.
- Drag and drop Control Module onto the **Project** Root
- In the resulting dialog box, enter the name **CM#\_FIC101\***

- Click **Finish** to add **CM#\_FIC101** to your project at the Root level

3 - 4

## Notes

### Creating and saving a module

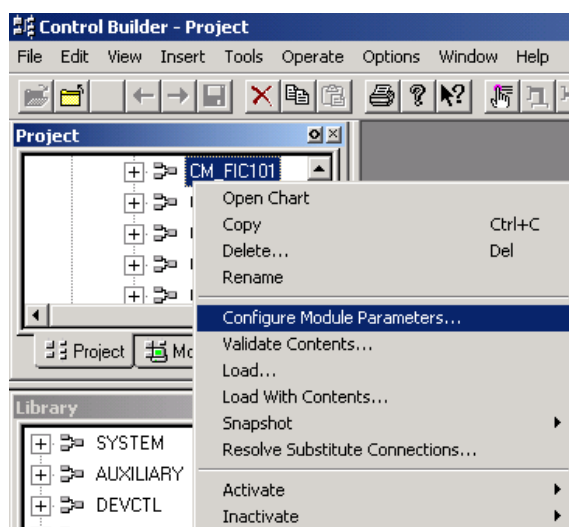

To create a Control Strategy, a Control Module must be created and function blocks inserted and connected. When you drag & drop the CM to the Project root it will appear under the Root Project Tree. Control Module names are sequentially numbered (for example, CM30, CM31, etc.). The new Control Module is automatically saved to your hard drive.

\*Normally CM names can be anything you like. For this course it is important that the names be exactly as shown in the labs. Any difference in the names will cause the SCMs constructed in later Lessons, along with supplied custom graphics for operations, not to work.

### Configuring a module

- Right click on **CM#\_FIC101**
- Click on **Configure Module Parameters** to call up top-level CM parameter entry screens

3 - 5

### Notes

#### Configuring a module

To configure a CM, you must do two things

- Define the parameters of the CEE level object.
- Create, configure, and connect function blocks

They can be done in any order. For this training we will configure the CEE level Control Module parameters first.

**Honeywell**

**Configuring a module ... continued**

- Enter the following parameters in the **Main** tab:

- Description **STEAM FLOW CTRL**
- Engr Units **M3/Sec**
- Keyword **STEAM**
- Execution Period **200MS**
- Execution Phase **0**

Main | Server

Name: CM\_FIC101 Execution Period: 200MS

Description: Steam Flow Controller Execution Phase: 0

Engr Units: M3/Sec Unit Text:

Keyword: STEAM Version:

- Click on the **Server** Tab and enter **sysDtlPIDA.dsp** for the Point Detail Page
- Enter **sysGrpPIDA.dsp** for the Group Detail Page
- Enter **A#** for the **Control Area**
- Click **OK**

Server Parameters

Point Detail Page sysDtlPIDA.dsp

Associated Display

Group Detail Page sysGrpPIDA.dsp

Control Level 200

Control Area A1

3 - 6

**Notes**

**Configuring a module**

It is important that you use descriptive names for **Description** and **Keyword**. The Description should represent what the CM will be doing in your project. In this example the CM will be controlling steam flow -- therefore, the keyword STEAM is used.

---

---

---

---

---

---

## Honeywell

### Assigning CMs to the CEE

- From the Control Builder Tools menu, click **Assign** to display the Controller Assignments screen
- Locate the **Available Modules** section on the left side of the window and Click **CM#\_FIC101** in the tab labeled CM/SCMs
- Select the destination CEE
  - CEE0101
- Click **Assign** in the center of the window and after a few seconds, your CM will appear in the section of the window labeled **Assign Modules**
- Click **Close**

3 - 7

## Notes

### Assigning CMs to the CEE

Before you create and configure the function blocks in your CM, assign the CM and the IOMs to the CEE.

---

---

---

---

---

---

## Honeywell

### Adding Function Blocks to a CM

- Double-click the **CM (CM#\_FIC101)** in the **Project** Tab to open your CM so function blocks may be added
- Open the **Library** Tab in a Tree View window and expand the **IOCHANNEL** library
- Click the block named **AICHANNEL** and drag it into the CM
- Drag the following blocks into your CM, in this order:

<u>Library Directory</u>	<u>Block Name</u>
DATAACQ	DATAACQ
REGCTL	PID
IOCHANNEL	AOCHANNEL

3 - 8

### Notes

#### Adding Function Blocks to a CM

Once the CM and the IOMs are assigned to the same CEE, you can add function blocks to your CM and configure them.

For more information on how to add function blocks to a CM, refer to the *Control Building Guide, Control Module Creation, Creating an Instance of a Basic Function Block*.

When adding Function Blocks you may want to close one of the tree-views to give yourself more space to edit your CM. To do this you

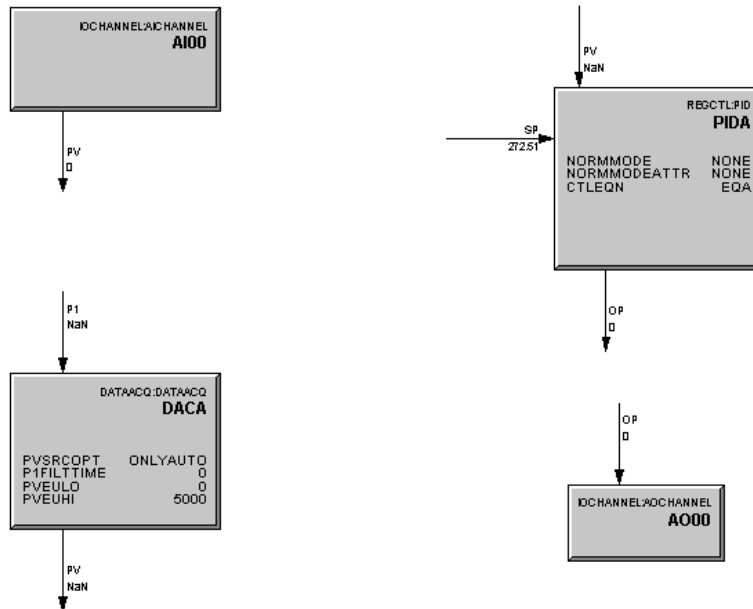

- Click Tree View window
- Click the Close button on the toolbar (second icon from the left)

**Honeywell**

**Adding Function Blocks to a CM ...continued**

- Arrange your blocks on the screen as shown below.

3 - 9

**Notes**

You may find it useful to close both tree views at this point, which will enable you the space to arrange the blocks in this manner without having to scroll.

Select each tree view individually by clicking on one of the tree view tabs or the title bar.

Click **File -> Close** or click on the Close toolbar button for each tree view window.

## Honeywell

### Configuring an AI Channel block

- Double-click the **AICHANNEL** block
- Name the block **AIn1** (where **n1** is the first AI channel on your partition sheet)
- Click the Module Name port and click **AI\_IOM\_01** to display the IOM

Channel Number	Channel Name
0	CM_FIC101.AI00
1	

- In the box labeled Currently Assigned Slots In Selected Module, click **Slot n1** (where **n1** is the first AI channel on your partition sheet)
- Click **Assign Channel**
- Click **OK** to close the AICHANNEL Parameter configuration form

3 - 10

## Notes

### Configuring an AI Channel block

Once the CM and the IOMs are assigned to the same CEE, you can add function blocks to your CM and configure them.

For more information on how to configure function blocks, refer to the *Control Building Guide*, *Control Module Creation*, *Using the Parameters Configuration form*.

The name of the module and the name of the channel appear by the slot. This helps you keep track of which slots are assigned and which slots are available in each of your IOMs.

### Configuring a Data Acquisition block

- Double-click the **DATAACQ** block
- Enter the following information:
  - Name **DACA** ⚠
  - Engr Units **M3/Sec**
  - Execution Order **20**
  - PVEU Range Hi **5000**
  - PVEU Range Lo **0**
  - PV Limits Hi **5500**
  - PV Limits Lo **0**
  - PV Character **None**

- Clamping/Filtering
  - **ENABLE**

3 - 11

### Notes

#### Configuring a Data Acquisition block

The PVEU Range is set to the Hi and Lo limits for the process steam. In the PVEU limits, because of our simulation, we have added a buffer of 500 to prevent the PV from going to NaN (Not a Number).

#### Clamping

A clamping option of ENABLE is selected. Enabling clamping will force the PV to stop when the PV Limits Hi or Lo are reached. Again this prevents the PV from going to NaN.

For more information on how to configure function blocks, refer to the *Control Building Guide, Control Module Creation, Using the Parameters Configuration form*.

It is important that you name this block **DACA**. If you do not name the block **DACA**, you will not be able to see many parameters from the Station Point Detail Display.

## Honeywell

### Configuring a Data Acquisition block ... *continued*

- Click the **Alarms** tab
- Enter the following information on the **Alarms** form for

#### PV High:

– Trip Point      **4000**  
– Priority          **HIGH**  
– Severity        **0**

#### PV High High:

– Trip Point      **4500**  
– Priority          **URGENT**  
– Severity        **0**

	Trip Point	Priority	Severity
PV High High :	4500	URGENT	0
PV High :	4000	HIGH	0

- Click **OK** to close the **DATAACQ** block

3 - 12

## Notes

### Configuring Alarms

The Alarms in the DATAACQ block must be set within the range of your PVEU Range Hi and PVEU Range Low. This will cause your block to go into Alarm if the ranges are Exceeded.

It is important that you follow the sequence. The system will not allow you to enter the PV High High before you enter the PV High.

## Honeywell

### Configuring a PID block

- Double-click the **PID** block
- Enter the following information:
  - Name **PIDA** ⚠
  - Engr Units **M3/Sec**
  - Execution Order **30**
  - PVEU RANGE HI **5000**
  - PVEU RANGE LOW **0**
- Click the **Algorithm** tab
- Enter the following algorithm information :
  - T1 **0.1**
  - T1 High Limit **2.0**
  - High Gain Limit **2.0**
  - Gain Options **Check LIN**
  - Overall Gain **.5**

Configuration Parameters | Monitoring Parameters | Block Preferences

Main | Algorithm | SetPoint | Output | Alarms | SCM | Block Pins

Control Equation Type: **EQA**

Control Action: ☐ DIRECT ☒ REVERSE

Integral Time

T1 (minutes): **0.1**

T1 High Limit (minutes): **2**

T1 Low Limit (minutes): **0**

Gain Options

☒ LIN

Overall Gain: **0.5**

☐ GAP

Gap High Limit: **0**

Gap Low Limit: **0**

Gap Gain Factor: **1**

Linear Gain Factor: **1**

3 - 13

## Notes

### Configuring a PID block

For more information on how to configure function blocks, refer to the *Control Building Guide, Control Module Creation, Using the Parameters Configuration form*.

It is important that you name this block **PIDA**. If you do not name the block **PIDA**, you will not be able to see many parameters from the Station software Detail Displays.

**Configuring a PID block ...continued**

- Click the **Alarms** Tab
- Enter the following information on the Alarms form for OP High (OPHI):

- Trip Point           **95**
- Priority               **Low**
- Severity             **0**

Type	Enable Alarm	Trip Point	Priority	Severity
OP High		95	Low	0
OP Low		NaN	Low	0

- Click the **SetPoint** Tab
- Enter the following information on for the Input Range:
  - High Limit           **5000**
  - Low Limit            **0**
- Click **OK** to close the PID parameter configuration form

3 - 14

**Notes**

---

---

---

---

---

---

---

---

---

## Honeywell

### Moving Pins on Function Blocks ⚠

- Click on the **PID** block, then right click to show the drop-down menu. Select **Configure Parameters ... PID Block Object**.
- On the Configuration Form, click the **Block Pins** tab
- Click on **PV** in the Input-Top box
- Click on **Remove**

3 - 15

## Notes

### Moving Pins on Function Blocks

For more information on adding and removing pins on function blocks, refer to the *Control Building Guide, Control Module Creation, Using the Block Configuration form*.

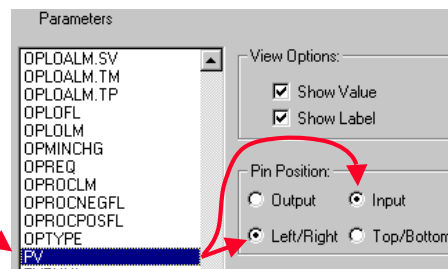

In order to make the routing of the soft wiring from the **DACA** block to the **PIDA** block more direct and neat, we will move the PV input from the top of the **PIDA** block to the Left. To accomplish this we must first remove the pin and then reinsert it in the proper location. This will not improve performance, just clean up the wiring.

## Honeywell

### Moving Pins on Function Blocks ...continued

- Click on **PV** in the Parameters box and ensure that Pin Position has Input and Left/Right selected

- Then click on **Add** and **OK**
- The PV Pin position should now appear on the left side of your PID function block

3 - 16

## Notes

### Moving Pin's on Function Block's

For more information on Adding and Removing Pins on function blocks, refer to the *Control Building Guide, Control Module Creation, Using the Block Configuration form.*

Here we add the PV pin to the PID Block in the Input, Left/Right location. In this location the soft wiring will be much cleaner.

## Honeywell

### Configuring an AO block

- Double-click the **AOCCHANNEL** block
- Name the block **AOn1** (where **n1** is the first AO channel on your partition sheet)
- Click the **Module Name** port and click **AO\_IOM\_01** to display the IOM
- In the box labeled **Currently Assigned Slots In Selected Module**, click **Slot n1** (where **n1** is the first AO channel on your partition sheet)
- Click **Assign Channel**
- Click **OK** to close the **AOCCHANNEL** function block

The screenshot shows the 'Channel Block Configuration' dialog box. The 'Channel Name' is set to 'A000' and the 'Execution Order in CM' is set to '30'. Below this, the 'Channel Block to IO Module Assignment' section shows 'Module Name' as 'AO\_IOM\_01' and 'Module Type' as 'Analog Output, 6 ch, 4-20 mA, Isolated'. A table at the bottom lists the assigned channels:

Channel Number	Channel Name
0	CM_FIC101.A000
1	

3 - 17

## Notes

### Configuring a Data Acquisition block

For more information on how to configure function blocks, refer to the *Control Building Guide, Control Module Creation, Using the Parameters Configuration form*.

## Honeywell

### Connecting Function Blocks

#### Using the Menu Method

- Click
  - **Insert**
    - **Wire**
- On the **AICHANNEL** block, click the pin labeled **PV**
- On the **DATAACQ** block, click the pin labeled **P1** and a wire will connect the two pins

3 - 18

## Notes

### Before you begin

Your final step in this Creating a Control Module tutorial is to connect the function blocks together to form a control strategy. (You can connect blocks together at any time you choose, before or after configuring block parameters.)

For more information on how to connect function blocks, refer to the *Control Building Guide, Control Module Creation, Connecting and Disconnecting blocks.*

### Methods

#### Menu Method

- Open a CM in the Project tab
- Click Tools > Wire and observe the cursor change to a plus ( + ) sign
- On one block, click the pin to be wired from
- On another block, click the pin to be wired to and a wire is connected between them.

*Methods continued on the next page...*

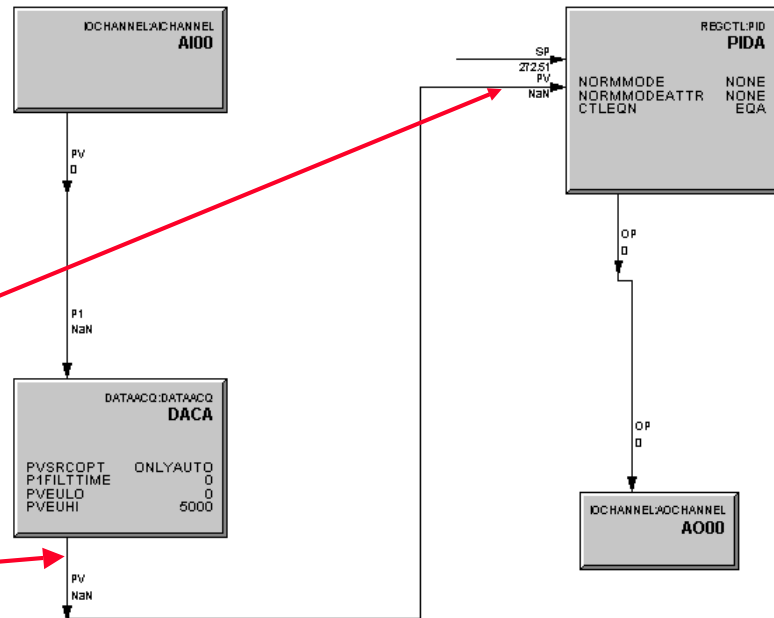

## Honeywell

### Connecting Function Blocks

#### Using the Quick Method

- Open the **FIC101** CM in the **Project** tab
- Double-click on the pin labeled **PV** at the bottom of the **DATAACQ** block
- Click the **PID** block pin labeled **PV** and a wire connects the two pins
- Complete the rest of the connections as shown
- Close and Save Changes to the CM

3 - 19

## Notes

### Methods ...continued

#### Quick Method

- Open a CM in the Project tab
- Double-click on the pin to be wired from and observe the cursor change to a plus ( + ) sign
- Click the pin to be wired to and a wire connects the two block parameters together

If you are trying to route a wire through a specific location you can do this by clicking at turn points between pin connections, as in the connection above between the **DACA** and **PIDA** blocks. Just double click on the **DACA** bottom pin and then click over to the right and it will draw the first part of your wire. Continue this to complete the wire connection. You can put as many bends and turns in a wire as you like. When you reach an appropriate destination, the destination arrow will turn Cyan.

**Honeywell**

**This completes....**

**PlantScape Controller Implementation**

**Lesson 1**

**Configuring a  
Continuous Control Strategy**

# **PlantScape Controller Implementation**

## **Lesson 2**

### **Configuring the Heat Cascade**

---

3 - 21

---

#### **Notes**

##### **Introduction**

The purpose of this Lesson is to give you the knowledge to be able to configure a Cascade control strategy. You will use **CM#\_FIC101** as a template for the temperature controller, the Cascade primary. After you complete this Lesson you should be able to copy and modify CMs, and implement and understand Parameter Connectors.

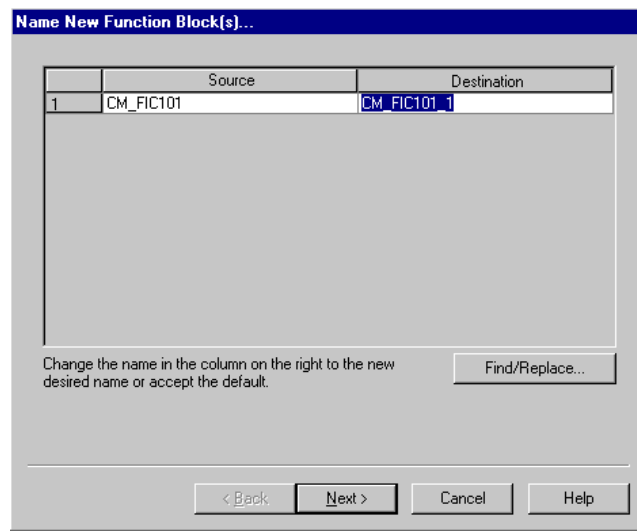

##### **Objectives**

- ❶ Understand Parameter Connectors
- ❷ Understand how to copy and modify existing CMs to create similar CMs
- ❸ Configure a Cascade Strategy

**Honeywell**

### Copying a CM

- Open the **Project** view in Control Builder and select **CM#\_FIC101**
- From the drop down menu Click
  - **Edit**
    - **Copy**
- This will bring up the Name New Function Block(s) screen. On this screen you will be able to change the Control Modules name.

3 - 22

### Notes

#### Copying a CM

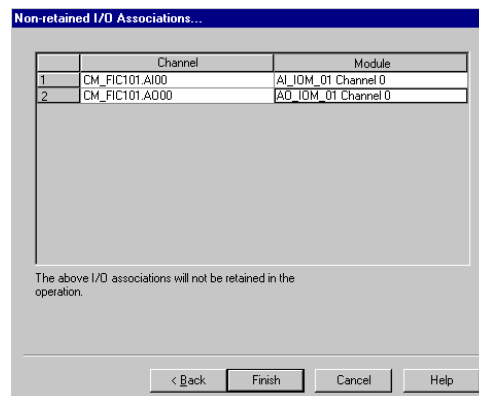

Copying a CM to create a similar CM is a common, time-saving technique because

- function blocks and their connections are already present
- many parameters do not have to be modified
- parameters that must be modified, such as the CM name and I/O channel assignments, can be modified from initial dialog boxes or are automatically cleared and set up for data entry

## Copying a CM

- Modify the Destination name:
  - Name **CM#\_TIC101**
- Click **Next** button
- The next screen will be the Non-retained I/O Associations. The list of channel associations that will be deleted is displayed. These will have to be reconfigured on the new CM.
- Click **Finish** button
- The result will be a new CM under the Project Root which will be the primary of the cascade

3 - 23

## Notes

**Honeywell**

### Configuring Parameters

- Select and then right click on the new CM
- Select
  - **Configure Module Parameters...**
- Modify the settings to match the information below:
  - Description **TEMP CTRL LOOP**
  - Engr Units **DEG C**
  - Keyword **TEMPERATURE**

Main		Server	
Name:	CM_TIC101	Execution Period:	200MS
Description:	TEMP CTRL LOOP	Execution Phase:	0
Engr Units:	DEG C	Unit Text:	
Keyword:	TEMPERATURE	Version:	
Enable Alarming Option:	<input checked="" type="checkbox"/>	SCM Option:	NONE
Execution Order in CEE:	10	SCM Name:	de_scm_temp

- Click **OK**
- Assign **CM#\_TIC101** to **CEE0101**

3 - 24

### Notes

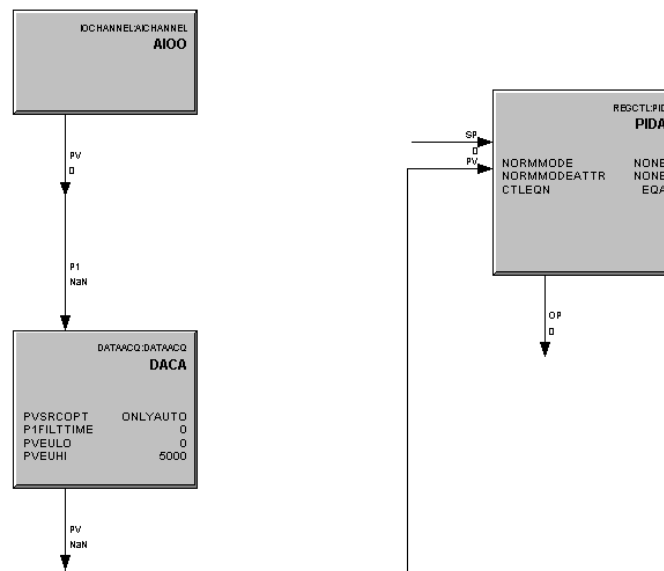

#### Configuring Parameters

When you use the Copy CM technique to create a new CM, you need to change parameters on the Main page of the Parameters Configuration form. On the Server page, Point Detail and Group Display references are copied and do not have to be re-entered.

**Honeywell**

### Modifying the CM

- Double Click on **CM#\_TIC101** to open it in the Control Drawing area
- Select the connector soft-wire from the **PID** block to the **AOCHANNEL** block and press the <delete> key
- Select the **AOCHANNEL** block and press the <delete> key

3 - 25

### Notes

#### Modifying the CM

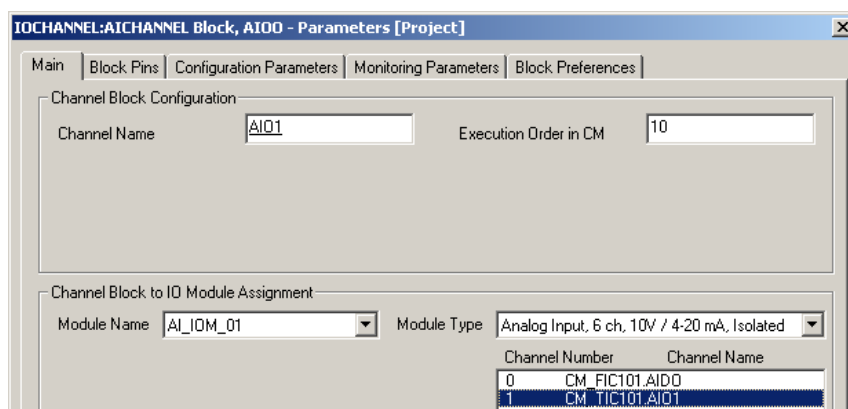

It is always a good idea to keep the CM organized and free of any unneeded components. Components that are removed or rearranged can always be added back if needed at a later time.

Here we remove the AOCHANNEL block because CM#\_TIC101 will be the primary in a Cascade strategy. Its OP will be incorporated as a parameter connector to the secondary's SP

## Honeywell

### Configuring Blocks, AICHANNEL

- Double Click on the **AICHANNEL** block
- Name the block **AI $n2$**  (where  **$n2$**  is the second AI channel on your partition sheet)
- Click the **Module Name** port and click **AI\_IOM\_01**
- In the box labeled **Channel Number Channel Name**, click **Slot  $n2$**  (where  **$n2$**  is the second AI channel on your partition sheet)
- Click **Assign Channel**

- Click **OK** to close the AICHANNEL Parameter configuration form

3 - 26

## Notes

### Configuring Blocks, DATAACQ

- Double Click on the **DATAACQ**
- Modify the settings to match the information below:
 

– Name	<b>DACA</b>	– PVEU Range Lo	<b>0</b>
– Description	<b>TEMP CTRL</b>	– PV Limits Hi	<b>100</b>
– PVEU Range Hi	<b>100</b>	– PV Limits Lo	<b>0</b>
– Engr Units	<b>DegC</b>		

3 - 27

### Notes

#### Configuring Blocks, DATAACQ

The **DATAACQ** block for all PID Loop CMs must be named **DACA** so that the supplied PlantScape station PID Point Detail display can be used.

---

---

---

---

---

---

---

---

---

---

### Configuring Blocks, DATAACQ ...continued

- Click on the **Alarms** Tab
- Modify the settings to match the information below:

	<u>Trip Point</u>	<u>Priority</u>	<u>Severity</u>
– PV High High	<b>95</b>	<b>URGENT</b>	<b>0</b>
– PV High	<b>92</b>	<b>HIGH</b>	<b>0</b>

- Click **OK**

3 - 28

## Notes

### Configuring Blocks, DATAACQ

A primary reason that the DATAACQ block is added to PID Loop CMs is for high and low PV alarming.

Note that the PV High limit must be configured before the PV High High limit.

---

---

---

---

---

---

### Configuring Blocks, PID

- Double Click on the **PID** Block
- Modify the settings to match the information below:
  - Name **PIDA**
  - Engineering units **DEG C**
  - PVEU Range HI **100**
  - PVEU Range Low **0**

REGCTL:PID Block, PIDA - Parameters [Project]

Configuration Parameters | Monitoring Parameters | Block Preferences

Main | Algorithm | SetPoint | Output | Alarms | SCM | Block Pins

Name:  Execution Order in CM:

Description:

Engineering Units:

Process Variable

PVEU Range Hi:

PVEU Range Low:

Manual PV Option:

Mode

Normal Mode:

Normal Mode Attribute:

Mode:

Mode Attribute:

☒ Permit Operator Mode Changes

3 - 29

### Notes

#### Configuring Blocks, PID

The **PID** block must be named **PIDA** so that the supplied PlantScape station Point Detail display can be used.

The **PID** block contains a large amount of functionality. It has several pages of configuration parameters. Because many parameters are common to similar **PID** blocks, the copy technique is particularly useful here.

For more information on configuring PID blocks, refer to *Control Builder, Components Theory, Regulatory Control, PID Block*.

**Honeywell**

**Configuring Blocks, PID ...continued**

- Click on the **SetPoint** Tab
- Modify the settings to match the information below:
  - High Limit **100**
  - Low Limit **0**

The screenshot shows a configuration window with the following elements:

- Tabs: Main, Algorithm, **SetPoint**, Output, Alarms, SCM
- SP: 0
- Input Range:
  - High Limit: 100
  - Low Limit: 0

- Click **OK**

3 - 30

**Notes**

**Configuring Blocks, PID**

SP input range must be within the PVEUHI -- LO range.

---

---

---

---

---

---

---

---

- 
- ```

graph TD
    AIO1[AIO1] -- P1 NaN --> DACA[DACA]
    DACA -- P3 NaN --> AIO1
    AIO1 -- P2 0 --> DACA
    DACA -- P4 NaN --> AIO1
    AIO1 -- P5 0 --> DACA
    DACA -- P6 NaN --> AIO1
    AIO1 -- P7 0 --> DACA
    DACA -- P8 NaN --> AIO1
    AIO1 -- P9 0 --> DACA
    DACA -- P10 NaN --> AIO1
    AIO1 -- P11 0 --> DACA
    DACA -- P12 NaN --> AIO1
    
```

- 3 - 31

[illegible]

**Honeywell**

### Configuring CM#\_FIC101 for Cascade Strategy

- Double Click on CM#\_FIC101 in **Project** to open it

- Click on the **Parameter Connection** icon

- Single-click on the **PID** Block's **SP** pin;  
Move to the left of the arrow and double-click

- In the resulting port, enter the full name of the desired block connection, including Control Module, Function Block, & Parameter:

**CM#\_TIC101.PIDA.OP**

**Alternate Method:** Use the Point Selection Tool  
(see next slide)

3 - 32

### Notes

#### Adding a Parameter Connection

Parameter connections allow one CM to communicate with another CM. The CMs can be in the same controller or in different controllers communicating peer to peer over the Supervisory C-Net.

After clicking on the Parameter Connection icon your mouse pointer will turn into a cross-hair. The same technique used in wiring blocks together is used to add a Parameter Connector. You may add turning points to route your Parameter Connector in available space. You may also reposition the parameter connection after it is entered.

Note: If you want to cancel the connection operation before you are finished, press <Esc>.

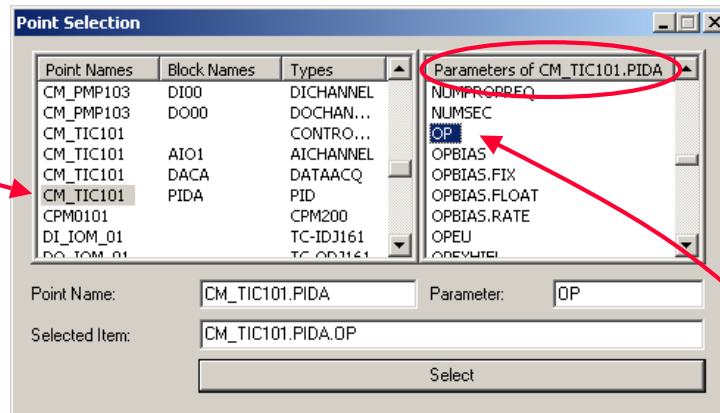

After Double Clicking you will be given a box to enter the information needed for the connection. You will need to enter:

- The name of the CM or SCM to which the connection is being made
- The Function Block within the CM or SCM to which the connection is being made
- The Parameter to which the connection is being made (e.g. CM#\_TIC101.PIDA.OP)

**Honeywell**

### Using the Point Selection Tool

- Click on the button with the dot leader icon (three dots) to access the Point Selection dialog box for a particular Parameter Connector.
- Select the desired Point Name from the list of **Point Names** and associated **Block Names/ Types** on the Point Selection dialog.

- Select the desired parameter from the list of the chosen Function Block parameters in the right-hand list box on the Point Selection dialog.
- Click the Select button and then click the Close button in the Point Selection dialog to close the dialog and return to the control drawing.

3 - 33

### Notes

#### Using the Point Selection Tool

Perform the indicated steps to use the Point Selection tool to find a desired point name and parameter when referencing a particular parameter expression.

---

---

---

---

---

---

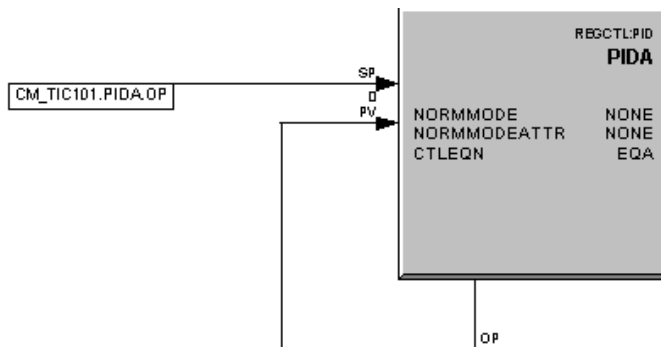

---

---

**Honeywell**

### Configuring CM#\_FIC101 for Cascade Strategy

- The completed Parameter Connection is shown below:

- Close and save **CM#\_FIC101**

3 - 34

## **Lesson 3**

### **Loading, Activating and Operating Control Modules**

---

3 - 37

---

#### **Notes**

##### **Introduction**

The purpose of this Lesson is to give you the knowledge to be able to load, activate and operate control strategies. You will become familiar with the operation of CMs from Station as well as from Control Builder.

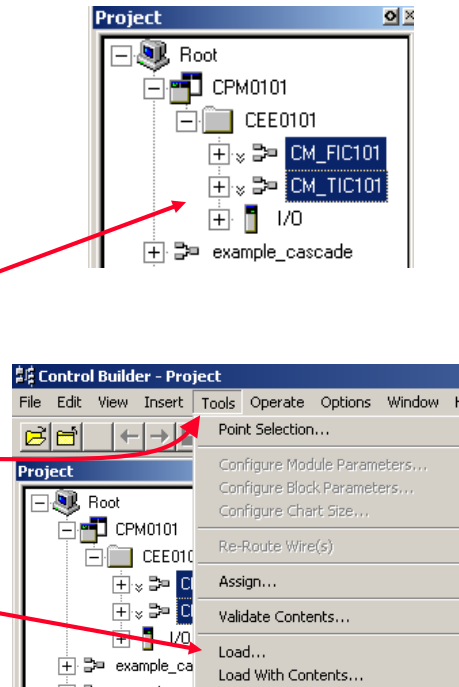

##### **Objectives**

- ❶ Understand Control Builder procedures that apply to CM configuration
- ❷ Understand the steps necessary to load and activate a control strategy
- ❸ Understand the characteristics associated with the **Project** and the **Monitoring** views of Control Builder

## Honeywell

### Loading a Control Strategy

- Ensure that the **CM#\_TIC101** and **CM#\_FIC101** are closed
- Open the **Project** tab in Control Builder
- Expand the Root Directory
- Select both **CM#\_TIC101** and **CM#\_FIC101**
- Click the **Tools** Menu
- Click **Load**

3 - 38

## Notes

### Before you begin

Once you have configured a control strategy, you must load the strategy to the controller before activating it.

Your strategy includes your CPM, CEE, IOMs, and CMs. Each of these are loaded in a simple procedure.

If you do not close your CM before loading it you will encounter a lock error, and will be forced to cancel the load.

For more information about loading and activating a control strategy refer to *Control Building Guide, Control Strategy Loading*.

## Honeywell

### Loading a Control Strategy

- Verify that the items to load are checked

- Click **OK**

- Note that you can decide to have the modules go to the active state automatically by clicking this checkbox with the **Post Load State** selected to be **ACTIVE**

| Load                                | Load List | Current State | State To Load | Post Load State |
|-------------------------------------|-----------|---------------|---------------|-----------------|
| <input checked="" type="checkbox"/> | CM_FIC101 | Not Loaded    | INACTIVE      | ACTIVE          |
| <input checked="" type="checkbox"/> | CM_TIC101 | Not Loaded    | INACTIVE      | ACTIVE          |

☐ Automatically change ALL control elements to the state selected in "Post Load State" after load is completed

OK Cancel Help

3 - 39

## Notes

### Before you begin

Once you have configured a control strategy, you must load the strategy to the controller before activating it.

Your strategy includes your CPM, CEE, IOMs, and CMs. Each of these are loaded in a simple procedure.

If you do not close your CM before loading it you will encounter a lock error, and will be forced to cancel the load.

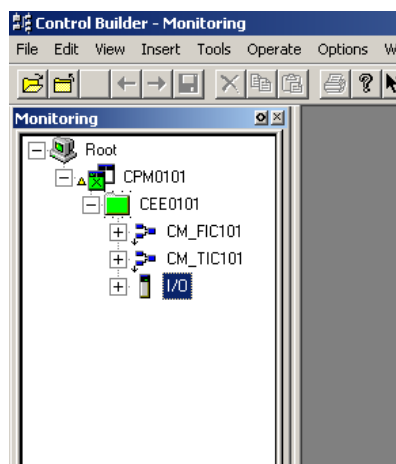

For more information about loading and activating a control strategy refer to *Control Building Guide, Control Strategy Loading*.

**Honeywell**

## Loading a Control Strategy ...continued

- Click **Monitoring** to go to the Monitoring (loaded) tab
- Activate **CM#\_TIC101** and **CM#\_FIC101**

3 - 40

## Notes

### Activating a Control Strategy

As with IOMs, there are many ways to activate CMs. One is to use the check box in the load dialog box to change loaded items to the post load state of **ACTIVE** (see Pg. 3-37). Another is to activate each item individually as we have done here. A third is to select multiple items in the Monitor tab and click **Operate → Activate → Selected Items**.

For more information about loading and activating a control strategy refer to *Control Building Guide, Control Strategy Loading*.

Once you activate the CM, it turns green in the **Monitoring** tab. Remember that the CEE must be active for anything assigned to the CEE to work. So, even if a CM is active, it won't do anything unless the CEE is also active.

**Honeywell**

## Configuring CMs for Cascade Operation

- Double click on **CM#\_FIC101** to open it in the Control drawing area
- Ensure that **PIDA** is in **MAN** mode (If it is not in **MAN** mode, place it in **MAN** mode)
- To place the **PIDA** block in **MAN** mode double-click on the word **MODE** on the blocks faceplate
- Select **MAN** from the drop down list

3 - 41

## Notes

### Configuring CMs for Cascade Operation

When changing the **OP** value, the **PID** block must be placed in **MAN** mode. If it is not you will be prompted with an invalid mode error.

**Honeywell**

## Configuring CMs for Cascade Operation ...continued

- Double Click **OP** on the **PID** block's face

- Enter a Value in % of **40** and Click **OK**

The dialog box titled "Request Value Change" has a text field labeled "OP Value in %" with the value "40" entered. Below the field is a checkbox labeled "Show Parameter Names". At the bottom are buttons for "OK", "Cancel", and "Help". A red arrow points to the "40" value in the text field.

- This will result in the **PV** climbing to a flow of approximately 2000 lb/hr.

3 - 42

## Notes

For more information about changing Function Block Parameters refer to *Control Building Guide, Control Module Creation, Requesting Value Change for Configuration Parameters*.

---

**Honeywell**

---

**Configuring CMs for Cascade Operation ...continued**

- Double-click **MODE** on **PIDA**'s face and set the **MODE** to **Cascade (CAS)**
- Leave **CM#\_FIC101** open and double-click on **CM#\_TIC101** in the **Monitoring** tab
- Change its **PIDA.MODE** to **AUTO**
- Enter a value of **40** on the Set Point (**SP**) Pin
- Select
  - **Window**
  - **Tile**

3 - 43

---

**Notes**

---

---

---

---

---

---

---

---

---

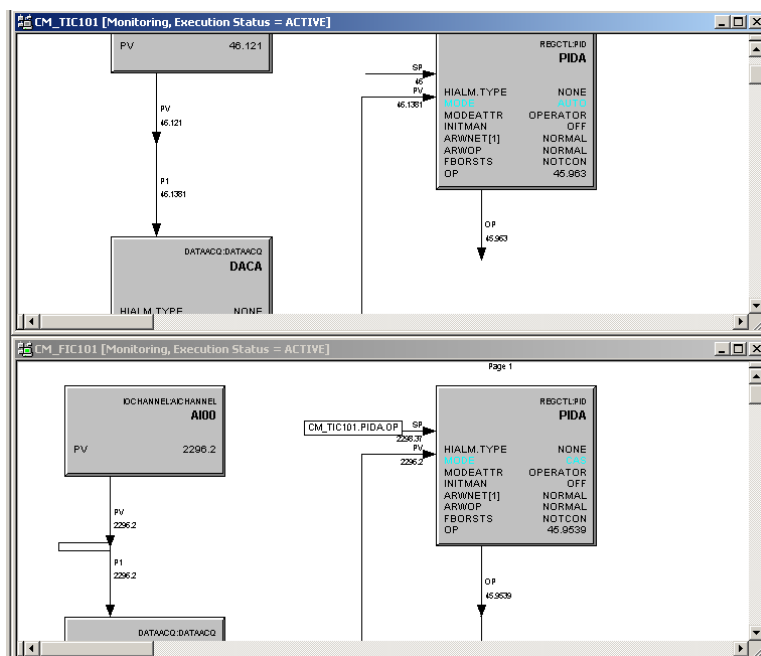

---

---

## Configuring CMs for Cascade Operation ...continued

- This will permit you to see CM#\_TIC101 and CM#\_FIC101 operating together

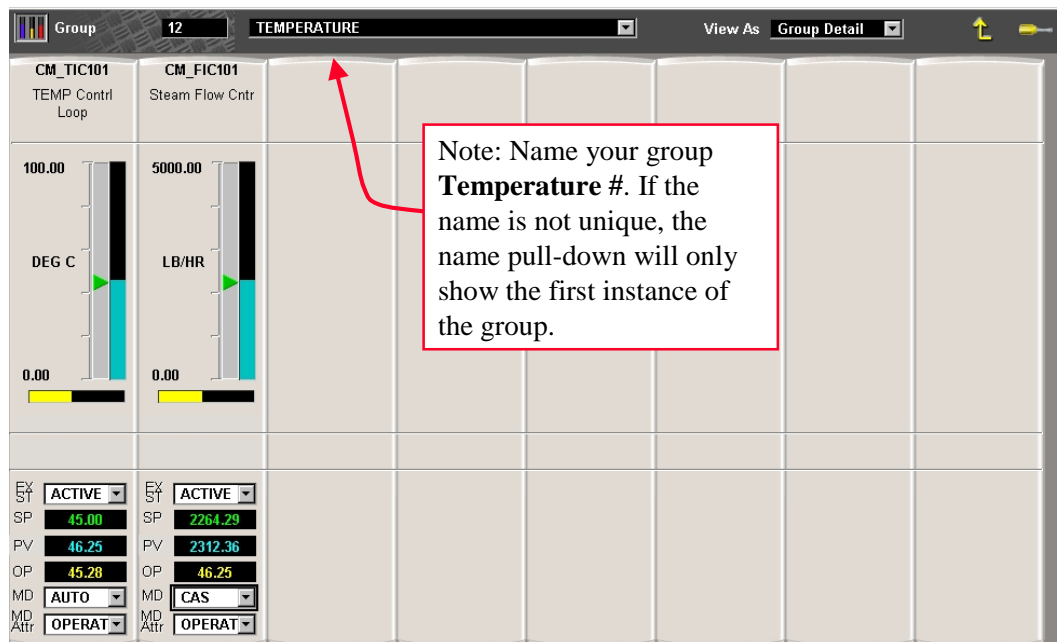

3 - 44

## Notes

**Honeywell**

## Configuring and Operating Group #2

- Go to station, log on as Manager and configure Group #2 in the following sequence

- Operate your Heat Cascade from Group #2 in station

3 - 45

## Notes

### Configuring and Operating Group #2

The password for Manager access level is mngr

CM#\_TIC101 Slot 1

CM#\_FIC101 Slot 2

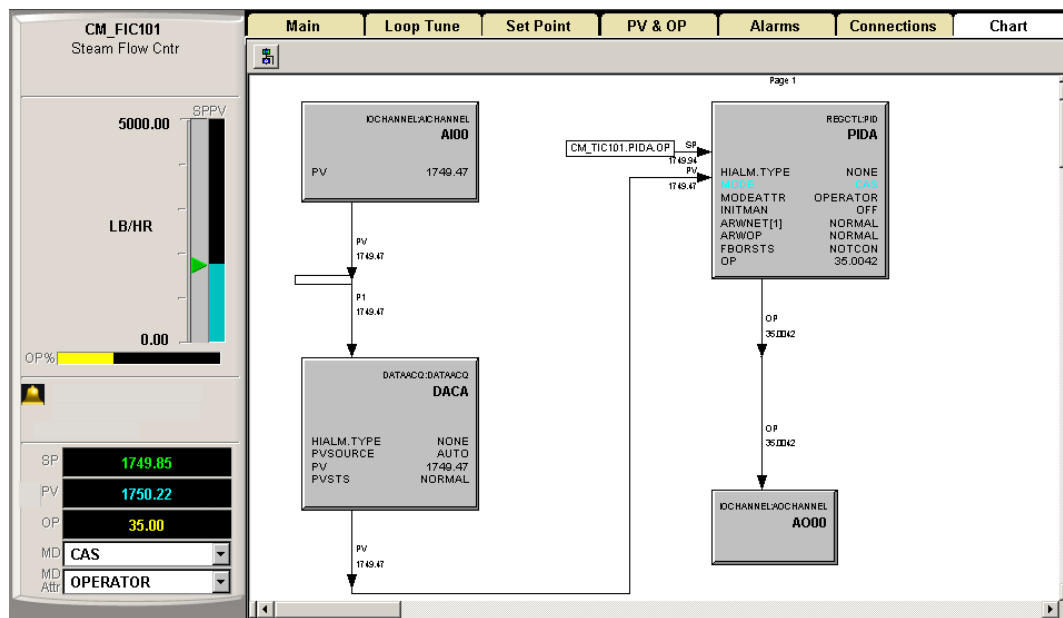

For more information about working with and configuring Station refer to *Operators Guide, Monitoring and Controlling, Using Group Displays*.

Honeywell

## Point Detail Chart Page

- Call up the Point Detail display of **CM#\_FIC101** and click on the **Chart** tab
- The **Chart** page is an active window into the **Monitoring** view of **Control Builder**. It is very useful in status monitoring and trouble-shooting since it has all the functionality of the Control Builder Monitoring window.

3 - 46

## Notes

### CM Detail Display -- Chart Page

The Chart page of the Detail is a window into the Control Builder Monitoring view of the CM. This page is very useful for monitoring and trouble shooting as it has the full functionality of the Monitoring view. It displays things hidden from the rest of the Detail such as Parameter Connections and Interlock Details

**Honeywell**

## Point Detail Chart Page

- Double-click on the top area of the PIDA block to call up the block details

- Note that the parameters are available for configuration when the Chart page is called up while logged into Station as MNGR

- Logoff and call up the Chart page while logged in as OPER
  - What do you notice about the PIDA details now?

EGCTL:PID Block, PIDA - Parameters [Monitoring]

Main | Algorithm | SetPoint | Output | Alarms | SCM

Name: PIDA

Description:

Engineering Units: LB/HR

Process Variable

PVEU Range Hi: 5000

PVEU Range Low: 0

Manual PV Option: SHEDHOLD

3 - 47

## Notes

### CM Detail Display -- Chart Page

If the Chart page is called up while logged into Station as Supervisor or higher, the page can be used to command the CM, the same way you would from Control Builder. Also, on-line configuration changes are available as they are in Monitor view.

# **PlantScape Controller Implementation**

## **Lesson 4**

### **PlantScape DbAdmin Familiarization**

---

3 - 49

---

#### **Notes**

#### **Introduction**

The purpose of this lesson is to give you the knowledge to be able to use the DbAdmin tool to help facilitate maintenance of the Engineering Repository database used by the PlantScape system.

#### **Objectives**

In practice a power failure or software problem might cause a database lock to be created. Normally these database locks occur only on those CM's or SCM's that might be open at the time of the abnormal shut down of Control Builder. In this lab we will cause an abnormal shutdown of Control builder so that we may practice using the DbAdmin tool.

## Control Builder Abnormal Shutdown

- If Control Builder is running, save your work at this time
- Select project view of your database in one of the tree windows.
- Double click and open CM\_FIC101
- Select anyone of the CM\_FIC101 Function Blocks and move it slightly
  - Leave CM\_FIC101 open
- Double click and open CM\_TIC101
- Slightly move anyone of CM\_TIC101 Function Blocks
  - Leave both CM\_FIC101 and CM\_TIC101 open.
  - **Do not save your database at this time.**
- Press <Ctrl> <Alt><Delete> buttons, all three buttons at one time
  - A Windows control panel should appear
- Select the Task Manager button
- Select the Applications tab.
- Select “Control Builder – Project” from the list of applications
- Making sure that “Control Builder – Project” is now highlighted in blue, select the End Task button.
  - **Do not respond to any Control Builder save the database message.**
  - Wait a few seconds for a message from Windows indicating that Windows cannot respond to the End Task request.
- Select End Task again when this Windows message appears.

3 - 50

## Notes

---

---

---

---

---

---

---

---

---

---

**Honeywell**

## Test Lock Status

- Restart Control Builder and attempt to open CM\_FIC101 and CM\_TIC101.
  - You should see a “Already In Use” warning similar to the one above
  - All the other CM’s should open normally

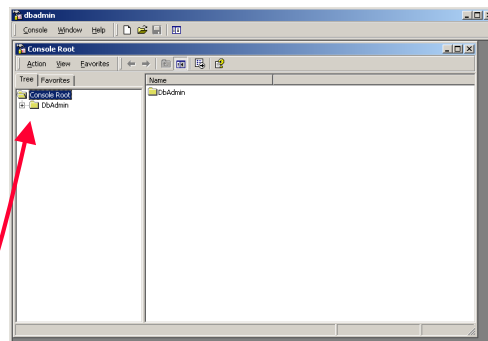

3 - 51

## Notes

## Honeywell

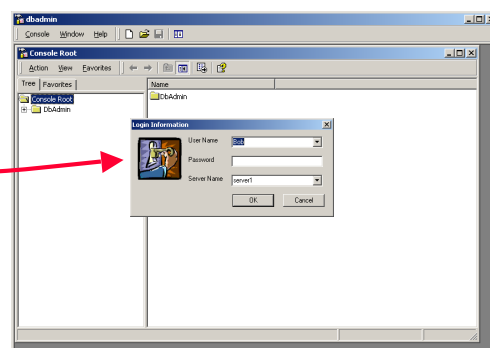

### Login to DBAdmin

- Click
  - Start
  - Programs
  - PlantScape Engineering Tools
  - DBAdmin

- Click on the **DBAdmin** folder in the tree pane

- Type in your **User Name** and **Password**. Make sure that the **Server Name** is correct. Then click the OK button.

3 - 52

## Notes

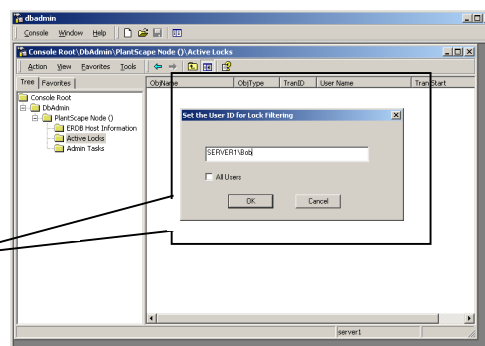

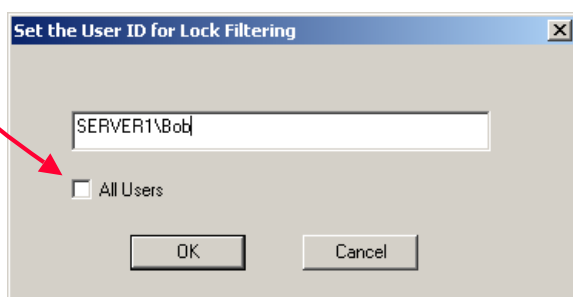

## Implement User Filter

- Click **Tools** on the menu bar. Then select **User Filter** from the pull down menu to call up the filter dialog box

- Deselect **All Users** and enter *your* User ID as shown in the View pane

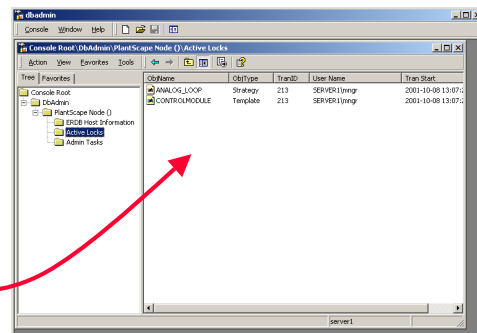

3 - 54

## Notes

Honeywell

## PlantScape System Architecture

- You should now see only those locked CMs that you created.

- Click **Tools** on the menu bar again. Then select **Clear Locks**
  - All your locks should now be cleared and the CMs should function normally in Control Builder

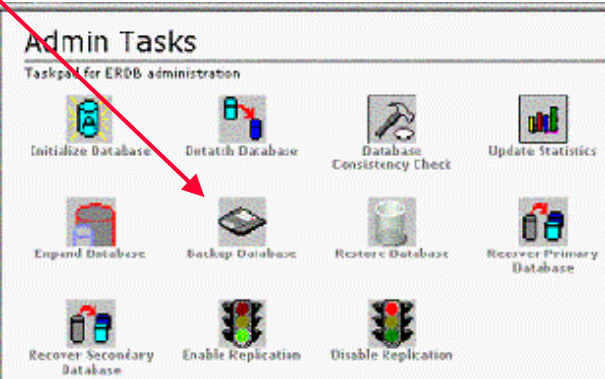

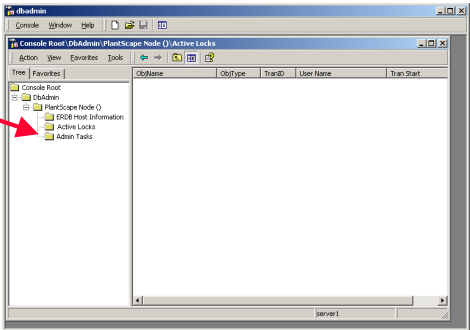

3 - 55

## Notes

PlantScope System Architecture

- Select **Admin Tasks** from in the tree pane.
- Click the **Backup Database** icon.

3 - 56

Notes

.

---

---

---

---

---

---

---

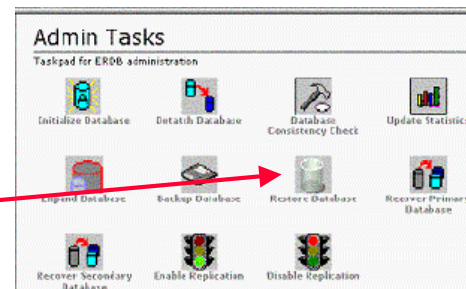

## Honeywell

### PlantScape System Architecture

- Change the save path to **C:\honeywell\tps50\system\er**  
Change file name to **ps\_erdb\_1.bak**  
Select **Save**

The **Restore Database** icon could be used at a later time to return the database to this saved state. Any changes made to the database after the last backup would be lost.

3 - 57

## Notes

Note - Backup databases can be used to recover the same server to a previously saved state. Backup databases should not be used to move a database from one server to another server.

**This completes....**

**PlantScape Controller Implementation**

**Lesson 4**

**PlantScape DbAdmin Familiarization**

3 - 58

**Notes**

- 4        Given the parameter connection reference: **TIC101.PIDA.OP**  
What is TIC101? \_\_\_\_\_  
What is PIDA? \_\_\_\_\_  
What is OP? \_\_\_\_\_
- 5        Before you can load a CM or IOM you must first assign it to a CEE.
- A     True  
          B     False
- 6        Before you can configure the I/O channels of a CM, you must first assign the CM and the IOM the channel references to the same CEE.
- A     True  
          B     False
- 7        Which of the following are ways to load CMs and IOMs?
- A     Select the corresponding CPM in the Project tab; Select: **Tools—Load with Contents...**  
          B     Select the CM or IOM in the Project tab and select the down arrow.  
          C     Select the CM or IOM in the Monitoring tab and select the down arrow.  
          D     Right click on the CPM in the Project tab; select **Load with Contents...**  
          E     All of the above

- 8 Which of the following are ways to activate CMs and IOMs?
- A Select the corresponding CEE in the Project tab; Select: ***Operate—Activate—This CEE's IOMs and - CMs...***
  - B Select the corresponding CEE in the Monitoring tab; Select: ***Operate—Activate—This CEE's IOMs - and CMs...***
  - C Select the CM or IOM in the Project tab; right click and select ***Activate***.
  - D Select the CM or IOM in the Monitoring tab; right click and select ***Activate***
- 9 In a PID loop CM, which function block provides PVHI and PVLO alarming?
- A AICHANNEL
  - B DATAACQ
  - C PID
  - D AOCHANNEL
- 10 In a PID loop CM, you must name the DATAACQ block DACA and the PID block PIDA in order to use the supplied Station detail display.
- A True
  - B False

# **Unit 4**

## **Device Control CMs**

---

**Honeywell**

---

# **PlantScape Controller Implementation**

## **Lesson 1**

### **Configuring a Two State Device Control Module**

---

4 - 3

---

#### **Notes**

##### **Introduction**

The purpose of this Lesson is to give you the knowledge to be able to create and configure a device control CM. Device control CMs give the operator a user friendly interface to the Digital I/O configured to control a two state valve, or a three state motor, etc. After you complete this Lesson you will have configured a two state device control module. Note: The output from the CM will cause a DO channel light to turn on when the valve is open. Feedback for the PV will be simulated by having hard-wired the DO channel back to same number DI channel.

##### **Objectives**

- ❶ Create a new CM named CM#\_FV101, using the knowledge you gained in Unit 4, to control a two state valve.
- ❷ Add and configure the Function Blocks needed to control the valve.
- ❸ Operate your newly created Device Control CM from station.

## Creating and Configuring a New CM

- Click
  - **File**
    - **New**
      - **Control Module**
- Double Click on the newly created CM in the control drawing area of Control Builder
- Enter the following information
  - Name **CM#\_FV101**
  - Description **PREWEIGH\_A VALVE**
  - Execution Period **100MS**

4 - 4

## Notes

### Creating and saving a module

To create a Control Strategy, a Control Module must be created. Then function blocks are inserted, configured, and connected.

After creating the Control Module it will appear under the Project Tree Root. Default Control Module names are sequentially numbered (for example, CM30, CM31, etc.). The new Control Module is automatically saved to your hard drive.

## Creating and Configuring a New CM ...continued

- Click on the **Server** tab
- Enter the following information
  - Point Detail Page **sysDtlDEVCTLA.dsp**
  - Group Detail Page **sysGrpDEVCTLA.dsp**
  - Control Area **A#**

|                    |                                                |
|--------------------|------------------------------------------------|
| Point Detail Page  | <input type="text" value="sysDtlDEVCTLA.dsp"/> |
| Associated Display | <input type="text"/>                           |
| Group Detail Page  | <input type="text" value="sysGrpDEVCTLA.dsp"/> |
| Control Level      | <input type="text" value="200"/>               |
| Control Area       | <input type="text" value="A1"/>                |

- Click **OK**
- Close **CM#\_FV101** and save changes
- Assign **CM#\_FV101** to **CEE0101**

4 - 5

## Notes

### Configuring a module

To configure a CM, you must do two things

- Define the parameters of the top-level object (the CM)
- Add, configure, and connect function blocks

They can be done in any order. For this training we will configure the Control Module parameters first.

### Assigning CMs to the CEE

Before you add and configure the function blocks in your CM, assign the CM to the CEE.

Before Control Builder will allow you to associate an IO channel block to an IOM (for example, associating the DI channel block in FV101 to DI\_IOM\_O1), it checks to be sure that the CM and the IOM are assigned to the same CEE.

**Honeywell**

## Adding and Configuring Function Blocks

- Open CM#\_FV101
- Click on the **Library** tab and add the following Function Blocks to CM#\_FV101

| <u>Library Directory</u> | <u>Block Name</u> |
|--------------------------|-------------------|
| – IOCHANNEL              | DICHANNEL         |
| – DEVCTL                 | DEVCTL            |
| – IOCHANNEL              | DOCHANNEL         |

4 - 6

## Notes

### Assigning Function Blocks to a CM

Once the CM and the IOMs are assigned to the same CEE, you can configure IOCHANNEL function blocks in your CM.

In our lab, we are simulating feedback for PVs. We have hard wired the outputs from the DO module to the corresponding inputs of the DI module. When the output from a device turns on, the feedback to the PV follows.

For more information on how to add function blocks to a CM, refer to the *Control Building Guide, Control Module Creation, Creating an Instance of a Basic Function Block*.

## Honeywell

### Adding and Configuring Function Blocks ...continued

- Double click on the **DICHANNEL** block and enter the following information
  - Enter **Channel Name** **DIn1** ( Where **n1** is the first DI channel on your partition sheet)
  - Select **Module Name** **DI\_IOM\_01**
  - Assign Channel **n1** ( Where **n1** is the first DI channel on your partition sheet;  
Note: Team 1 uses DI channels 0 - 7; Team 2 uses 8 - 15)

Channel Block Configuration

Channel Name: DI09 Execution Order in CM: 10 Input Bad Option: OFF

Channel Block to IO Module Assignment

Module Name: DI\_IOM\_01 Module Type: Digital Input, 16 ch, 24V DC, Isolated

Assigned to Module: UNASSIGNED

Assigned to Channel: UNASSIGNED

Assign Channel Block

Select an empty channel in the list box at right and press the "Assign Channel Block" button above.

| Channel Number | Channel Name |
|----------------|--------------|
| 0              |              |
| 1              |              |
| 2              |              |
| 3              |              |
| 4              |              |
| 5              |              |
| 6              |              |
| 7              |              |
| 8              |              |
| 9              |              |
| 10             |              |

4 - 7

## Notes

### Configuring a DICHANNEL Channel block

Once the DICHANNEL function block is configured to a Digital Input module, you will be able to assign it to a channel on the module. The channel would normally be hardwired from a real process device. In our training we are assigning this module to Channel Slot *n1*, the first DI channel on your partition sheet. This channel is hard wired from DO channel *n1*, and therefore when the valve is opened, the feedback will follow.

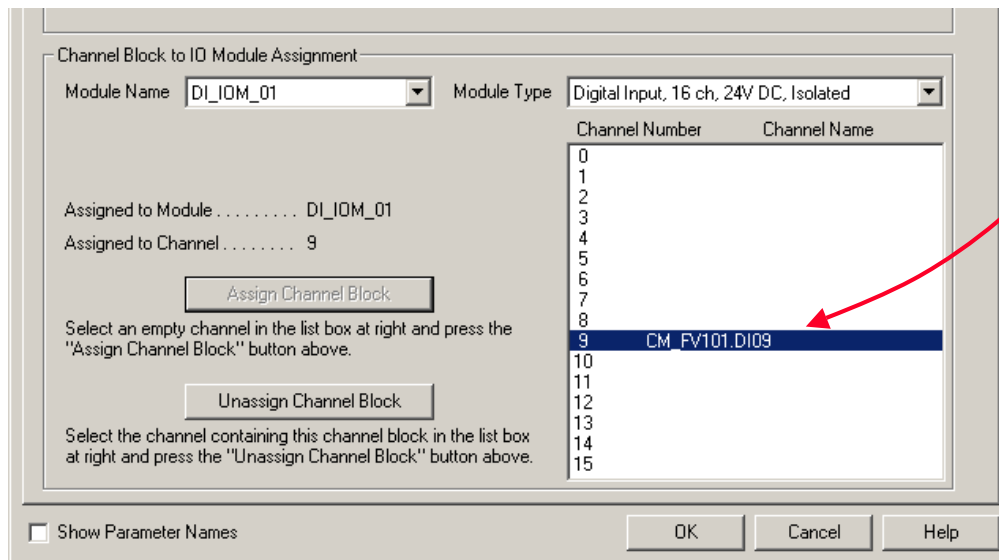

For more information on how to configure function blocks, refer to the *Control Building Guide, Control Module Creation, Using the Block Configuration Form.*

**Honeywell**

## Adding and Configuring Functions Blocks ...continued

- Note that the assignment now appears in the window: **CM\_FV101.DIn1**

- Click **OK**

4 - 8

## Notes

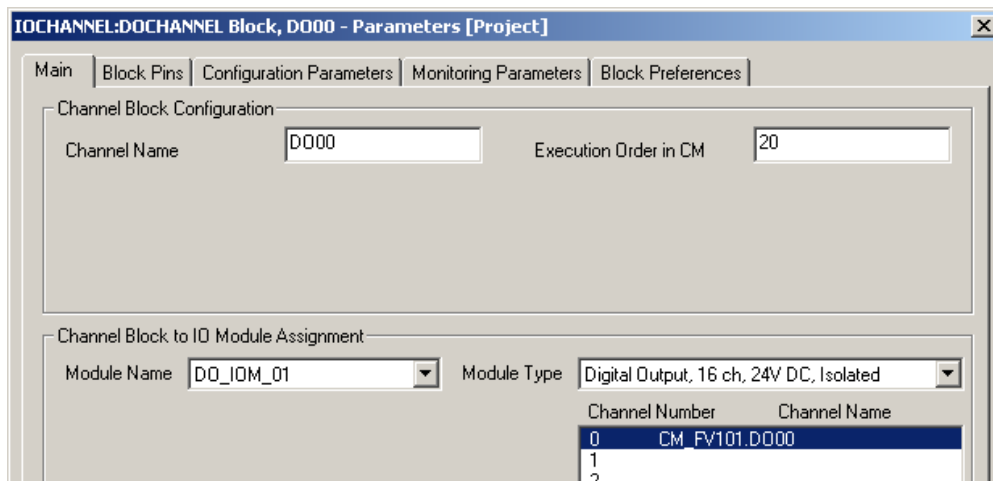

### Configuring a DICHANNEL Channel block

Once the DICHANNEL function block is assigned to a Digital Input module, you will be able to view the assignment whenever the properties of any DICHANNEL block on that same module are detailed. All assigned channels appear by the designator: CMname.FBname

**Honeywell**

## Adding and Configuring Functions Blocks ...continued

- Double click on the **DOCHANNEL** block and enter the following information
  - Channel Name **DOn1** (where **n1** is the first DO channel on your partition sheet)
  - Module Name **DO\_IOM\_01**
  - Assign Channel **n1** (where **n1** is the first DO channel on your partition sheet)

- Click **OK**

4 - 9

## Notes

### Configuring a DOCHANNEL Channel block

Once the DOCHANNEL is configured to a Digital Output module, you will be able to assign it to a channel on that module. The channel would normally be hardwired to a real process device. In our training we are assigning this module to Channel Slot *nn*, the first channel on your partition sheet. This will cause the DO channel light to turn on when output 1 in the Device Control Module is activated.

**Honeywell**

## Adding and Configuring Functions Blocks ...continued

- Open the **DEVCTLA** block
- Enter the following information in the Main tab:
  - Name **DEVCTLA**
  - Description **CM#\_FV101 DEVCTL**
- Enter the following Block Sizing Information:
  - Number of Inputs 1
  - Number of Outputs 1
  - Number of States 2
- Enter the following State Names Information:
  - State 1 Name **OPEN**
  - State 0 Name **CLOSED**

Configuration Parameters

| Main                         | Inputs | Output |
|------------------------------|--------|--------|
| Name: DEVCTLA                |        |        |
| Description: CM_FV101 DEVCTL |        |        |
| Engineering Units:           |        |        |

Block Sizing

|                    |   |
|--------------------|---|
| Number Of Inputs:  | 1 |
| Number Of Outputs: | 1 |
| Number Of States:  | 2 |

State Names

|               |        |
|---------------|--------|
| State 1 Name: | OPEN   |
| State 0 Name: | CLOSED |

4 - 10

## Notes

### Configuring DEVCTLA block

For this single input, single output scenario, we have specified two states for the Device Control Module. **State 1** is assigned the descriptor **OPEN** and **State 0** is assigned the descriptor **CLOSED** to indicate the open and closed states of the valve.

## Adding and Configuring Functions Blocks ...continued

- Click the **Inputs** tab and use the pull-down menus to select the following configuration

- Number of Digital Inputs: **1**
- Input 1 -- Unchecked : **Closed**
- Input 1 -- Checked : **Open**

Configuration Parameters

Main Inputs Output Maintenance

Number of Digital Inputs: 1

Inputs

| 4 | 3 | 2 | 1                                        |
|---|---|---|------------------------------------------|
|   |   |   | <input type="checkbox"/> Closed          |
|   |   |   | <input checked="" type="checkbox"/> Open |

4 - 11

## Notes

### Configuring DEVCTLA block

In our lab, Input 1 in the ON state signifies that the valve is Open. We configure the Inputs tab accordingly.

**Honeywell**

## Adding and Configuring Functions Blocks ...continued

- Click the **Outputs** tab and enter the following information
  - Number of Digital Outputs **1**
  - Output 1 - OPEN state **checked**
  - Output 1 - CLOSED state **unchecked**

|         | Outputs                  |                          |                                     | State Name | Safe                             |
|---------|--------------------------|--------------------------|-------------------------------------|------------|----------------------------------|
|         | 3                        | 2                        | 1                                   |            |                                  |
| State 1 | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> | Open       | <input checked="" type="radio"/> |
| State 0 | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/>            | Closed     | <input type="radio"/>            |
| State 2 | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/>            |            | <input type="radio"/>            |

4 - 12

## Notes

### Configuring DEVCTLA block

In this scenario we have configured Output 1 to go on when the operator selects State 1, OPEN. When the OP of CM#\_FV101 is changed to OPEN, its configured digital output goes to the On state, as shown by the associated DO channel light turning on.

Adding and Configuring Functions Blocks ...continued

- Click the **Alarms** tab and enter the following information
- |                    | <b>CLOSED</b> | <b>OPEN</b> | <b>Priority</b> | <b>State 2</b> | <b>Severity</b> |
|--------------------|---------------|-------------|-----------------|----------------|-----------------|
| - Command Disagree | <b>5</b>      | <b>10</b>   | <b>HIGH</b>     | <b>N/A</b>     | <b>0</b>        |
| - Command Fail     | <b>0</b>      | <b>0</b>    | <b>LOW</b>      | <b>N/A</b>     | <b>0</b>        |
| - Bad PV           |               |             |                 | <b>LOW</b>     | <b>0</b>        |

- Click **OK**

4 - 13

## Wiring Blocks

- Arrange blocks and wire them together as shown
- Close **CM#\_FV101** and save changes
- Load and Activate **CM#\_FV101**

4 - 14

## Notes

### Wiring Blocks

Your final step in this Creating a Control Module training is to connect the function blocks together to form a control strategy. You can connect blocks together at any time you choose, before or after configuring them.

For more information on how to connect Function Blocks, refer to the *Control Building Guide, Control Module Creation, Connecting and Disconnecting blocks*.

### Quick Method

- Open a CM in the **Project** tab
- Double-click on the pin to be wired from and observe the cursor change to a plus ( + ) sign and the pin turn cyan
- Click the pin to be wired to; the pin turns cyan to indicate a proper connection and a wire connects the two blocks

**Honeywell**

## Operating FV101 From Station

- In Station Command Zone, type in **CM#\_FV101** and click on the magnifying glass icon

- Click on **OP** and change the status from CLOSED to OPEN. Observe as the status changes from closed to open
- Add **CM#\_FV101** to Group #3, Slot1.
- Name the group Transfer A and B.
- Operate from the group.

4 - 15

## Notes

### Operating From Station

For more information on how to operate from Station refer to the *Operator's Guide, Getting Started*.

**This completes....**

# **PlantScape Controller Implementation**

## **Lesson 2**

### **Configuring a Three State Device Control Module**

---

4 - 17

---

#### **Notes**

#### **Introduction**

The purpose of this Lesson is to give you the knowledge to be able to create and configure a three state device control CM. After you complete this Lesson you will have configured and operated a three state device control module.

#### **Objectives**

- ❶ Create a new CM named **CM#\_AGIT101** using the knowledge you gained in Lesson 1, to control a three state agitator.
- ❷ Add and configure the Function Blocks needed to control the agitator
- ❸ Operate your newly created Device Control CM from Station

## Honeywell

### Creating and Configuring a New CM

- From the **Library** view expand the System tree and double click on CONTROLMODULE to create a new Control Module

- Double click in the new Control module drawing

- Enter the following information:

– **Main Tab**

- Name **CM#\_AGIT101**
- Description **REACTOR 3 STATE AGITATR**

|              |                                                      |
|--------------|------------------------------------------------------|
| Name:        | <input type="text" value="CM AGIT101"/>              |
| Description: | <input type="text" value="REACTOR 3-STATE AGITATR"/> |
| Engr Units:  | <input type="text"/>                                 |
| Keyword:     | <input type="text"/>                                 |

4 - 18

### Notes

#### Adding and Configuring a New CM

Since **CM#\_FV101** is a 2-State device and the agitator is a 3-State, copying and modifying is not effective. We will therefore create the agitator new from the Library. (You will also get more practice configuring a Device Control CM from scratch!)

When adding a new CM you can use any one of the following three methods:

- File > New > Control Module
- Drag a CM from the Library Tab to the Project Tab
- Double click on the CM in the Library Tab (This method adds the CM to the Project and opens the chart for configuration, in one step. It also allows more work area since only one tree needs to be open.)

## Creating and Configuring a New CM

- Enter the following information:

- **Server Tab**

- PDP      **SysDtlDEVCTLA.dsp**
    - GDP      **SysGrpDEVCTLA.dsp**
    - Control Area      **A#**

|                    |                                                |
|--------------------|------------------------------------------------|
| Point Detail Page  | <input type="text" value="sysDtlDEVCTLA.dsp"/> |
| Associated Display | <input type="text"/>                           |
| Group Detail Page  | <input type="text" value="sysGrpDEVCTLA.dsp"/> |
| Control Level      | <input type="text" value="200"/>               |
| Control Area       | <input type="text" value="A1"/>                |

- Click **OK**
  - Close and save **CM#\_AGIT101**.
  - Assign **CM#\_ AGIT101** to **CEE0101**

4 - 19

## Notes

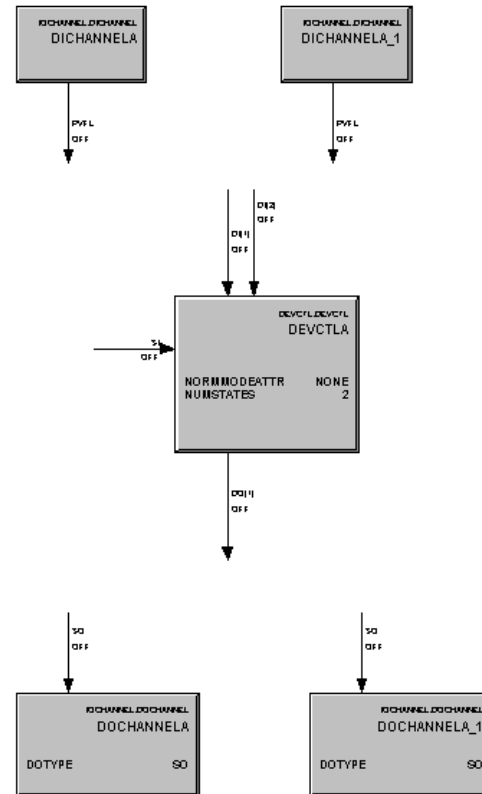

Before any Function Blocks are inserted into the CM, it is good practice to assign the CM to the corresponding CEE. This will enable you to completely configure the I/O Channel Function Blocks without having to close and reopen the CM. Recall that IO Channel blocks cannot be configured until their CM is assigned to a CEE.

**Honeywell**

## Adding and Configuring Functions Blocks

- Insert the following function blocks in CM#\_AGIT101
  - 2 DICHANNEL
  - 1 DEVCTL
  - 2 DOCHANNEL

- Arrange the blocks as shown

4 - 20

## Notes

### Adding and Configuring Function Blocks

The above arrangement is used for wiring reasons. In this instance the wiring specifics are known and we can arrange the blocks accordingly. In other cases, blocks may have to be rearranged several times during configuration to facilitate the soft wiring.

Arranging blocks can be demanding in a small work area. Closing one tree view can expand the work area. Also, scaling the display to make it smaller can facilitate this task.

## Honeywell

### Configuring the DICHANNEL Function Blocks

- Configure the left **DICHANNEL** with the following information
  - **Main Tab**
    - Name **DIn2** (where **n2** is the second DI channel on your partition sheet)
    - Module Name **DI\_IOM\_01**
    - Assign to Channel **n2** (where **n2** is the second DI channel on your partition sheet)
- Click **OK**
- Configure the right **DICHANNEL** with the following information
  - **Main Tab**
    - Name **DIn3** (where **n3** is the third DI channel on your partition sheet)
    - Module Name **DI\_IOM\_01**
    - Assign to Channel **n3** (where **n3** is the third DI channel on your partition sheet)
- Click **OK**

4 - 21

### Notes

#### Configuring the DOCHANNEL Function Blocks

Above we have selected channels 12 and 6 to assign our DOCHANNEL blocks. When DO channel light 12 comes on the Agitator will be active in low mode. When both 6 and 12 are on, this represents the Agitator being in high mode.

For more information on the DOCHANNEL block refer to the *Control Building Components Reference, DOCHANNEL block.*

## Honeywell

### Configuring the DOCHANNEL Function Blocks

- Configure the left **DOCHANNEL** with the following information
  - **Main Tab**
    - Name **DOn2** (where **n2** is the second DO channel on your partition sheet)
    - Module Name **DO\_IOM\_01**
    - Assign to Channel **n2** (where **n2** is the second DO channel on your partition sheet)
- Click **OK**
- Configure the right **DOCHANNEL** with the following information
  - **Main Tab**
    - Name **DOn3** (where **n3** is the third DO channel on your partition sheet)
    - Module Name **DO\_IOM\_01**
    - Assign to Channel **n3** (where **n3** is the third DO channel on your partition sheet)
- Click **OK**

4 - 22

### Notes

#### Configuring the DOCHANNEL Function Blocks

Above we have selected channels 12 and 6 to assign our DOCHANNEL blocks. When DO channel light 12 comes on the Agitator will be active in low mode. When both 6 and 12 are on, this represents the Agitator being in high mode.

For more information on the DOCHANNEL block refer to the *Control Building Components Reference, Reference Data for Functional Block Types, IO Channel Blocks, DOCHANNEL*

## Configuring the DEVCTL Function Block ...continued

- Configure the **DEVCTL** with the following information

- **Main tab**

- Name **DEVCTLA**
    - Description **DEVCTL FOR AGITATOR**

- **Block Sizing**

- Number of Inputs **2**
    - Number of Outputs **2**
    - Number of States **3**

- **State Names**

- State 1 Name **HIGH**
    - State 0 Name **LOW**
    - State 2 Name **STOPPED**
    - In Between Name **Inbet**
    - Null **Bad**

The screenshot shows the configuration form for the DEVCTL function block. It has two main sections: 'Block Sizing' and 'State Names'. In the 'Block Sizing' section, 'Number Of Inputs' is set to 2, 'Number Of Outputs' is set to 2, and 'Number Of States' is set to 3. In the 'State Names' section, 'State 1 Name' is 'HIGH', 'State 0 Name' is 'LOW', 'State 2 Name' is 'STOPPED', 'In Between' is 'Inbet', and 'Null' is 'Bad'.

4 - 23

## Notes

### Device Control State Assignments

The Device Control CM is designed to give the operator a user friendly interface to the digital I/O signals which control a 2 or 3-State device.

For this double input, double output scenario, we have specified three states for the Device Control Module. State 1 is assigned the name HIGH, state 0 is assigned the name LOW, state 2 is assigned the name STOPPED and the Inbetween state is assigned the name Inbet.

For more information on how to configure function blocks, refer to the Control Building Guide, Control Module Creation, Using the Parameters Configuration Form.

**Honeywell**

## Configuring the DEVCTL Function Block ...continued

- Configure the **DEVCTL Inputs** tab with the following information
  - Number of Digital Inputs **2**

| Input 2 | Input 1 | State Descriptor |
|---------|---------|------------------|
| off     | off     | <b>STOPPED</b>   |
| off     | on      | <b>LOW</b>       |
| on      | off     | <b>HIGH</b>      |
| on      | on      | <b>Bad</b>       |

CTL:DEVCTL Block, DEVCTLA - Parameters [Project]

Configuration Parameters

Main Inputs Output

Number of Digital Inputs: 2

Inputs

4 3 2 1

☐ ☐ STOPPED

☐ ☒ LOW

☒ ☐ HIGH

☒ ☒ Bad

4 - 24

## Notes

### Device Control Input Assignments

On the Inputs tab, enter the appropriate feedback inputs for the Device Control CM to handle the three-state device.

## Configuring the DEVCTL Function Block ...continued

- Configure the **DEVCTL Outputs** tab with the following information:

- Number of Digital Outputs: **2**

| Output 2 | Output 1 | State Name               |
|----------|----------|--------------------------|
| on       | off      | <b>HIGH</b> (State 1)    |
| off      | on       | <b>LOW</b> (State 0)     |
| off      | off      | <b>STOPPED</b> (State 2) |

- Safe State :** **STOPPED**
- Click **OK**

4 - 25

## Notes

### Device Control Output Assignments

Outputs for controlling the device are wired from the appropriate DO module(s) to the device and feedback inputs from the device are wired to the appropriate DI module(s).

DO and DI channel function blocks are then brought into the Device Control CM and configured to map to these DO and DI channels.

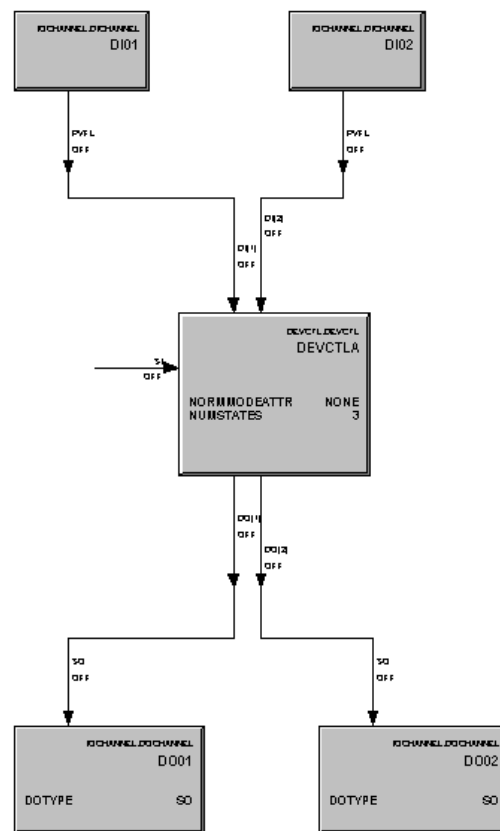

Using assigned states with specified names, corresponding output conditions are designated in the configured DEVCTL block to work in conjunction with the designated inputs for feedback to define device control requirements.

The operator (or SCM or Logic Interlock) can then pick a state for the device and the Device Control CM handles the correct inputs and outputs to control the device.

**Honeywell**

## Wire Blocks Together

- Wire blocks together as shown
- Close and save
- Download and Activate

4 - 26

## Notes

### Wire Blocks Together

According to the state assignments, when the operator selects state 0 (low), DO[1] will go true which will turn on DO channel light 12. When the operator selects state 1 (High) both outputs DO[1] and DO[2] will go true which will turn on both lights 12 and 6.

**Honeywell**

## Operating AGIT101 From Station

- Open **Station**
- Type in **CM#\_AGIT101** and Click on the magnifying glass icon

- Click on **OP** and change the status from STOPPED to LOW. Observe as the PV changes accordingly. Also observe DO channel light **n2** turns on along with DI channel **n2**.
- Click on **OP** and change the status from LOW to HIGH. Observe as the PV changes accordingly. Also observe DO light **n3** turns on along with DI channel **n3**.
- Stop the Agitator and observe the results

4 - 27

## Notes

### Before you begin

Operating from Control Builder is very useful, especially for troubleshooting and debugging, but for day-to-day operations you will probably prefer to use PlantScape's Station software.

**Honeywell**

**This completes....**

**PlantScape Controller Implementation**

**Lesson 2**

**Honeywell**

# **PlantScape Controller Implementation**

## **Lesson 3**

# **Control Module Skill Development**

4 - 29

### **Notes**

#### **Introduction**

The purpose of this Lesson is to give you the knowledge to be able to create and configure device control CMs using a similar CM as a template. After you complete this Lesson you will have configured all required Device Control modules needed for the project.

#### **Objectives**

- ❶ Create new CMs named CM#\_FV102, CM#\_FV103, CM#\_PMP101, CM#\_PMP102, and CM#\_PMP103 using the knowledge you gained in Lessons 1 and 2, and using FV#101 as a template
- ❷ Operate your newly created Device Control CMs from Station

## Honeywell

### Creating Remaining Device Control CMs

- Copy **CM#\_FV101** and use the information provided below to create the remaining two-state Device Control Modules needed for the project

| NAME       | DESCRIPTION          | D/I CHANNEL | D/O CHANNEL |
|------------|----------------------|-------------|-------------|
| CM#_FV102  | TANK B BOTTOM VALVE  | DIn4        | DOn4        |
| CM#_FV103  | REACTOR DRAIN VALVE  | DIn5        | DOn5        |
| CM#_PMP101 | TANK A TRANSFER PUMP | DIn6        | DOn6        |
| CM#_PMP102 | TANK B TRANSFER PUMP | DIn7        | DOn7        |
| CM#_PMP103 | REACTOR DRAIN PUMP   | DIn8        | DOn8        |

- All valves will use state names **OPEN (State 1)** and **CLOSED (State 0)** and will be virtual duplicates of **CM#\_FV101**
- All pumps will use state names **ON (State 1)** and **OFF (State 0)** and will be similar to **CM#\_FV101**
- All inputs use **DI\_IOM\_01**, all outputs use **DO\_IOM\_01**; channels as shown on your partition sheet. Recall that you must assign the CMs prior to configuring the channel blocks.

4 - 30

### Notes

#### Creating Remaining Device Control CMs

In this lesson you will be using the knowledge gained in previous Lessons to create new Control Modules. You must remember the primary rules used to create Control Modules

- Use one of three methods to create a new CM (or copy a similar CM)
- Configure the top-level parameters of the CM
- Close and save changes
- Assign CM to **CEE**
- Add and Configure Function blocks
- Wire Function blocks
- Load and Activate CMs
- Test CMs

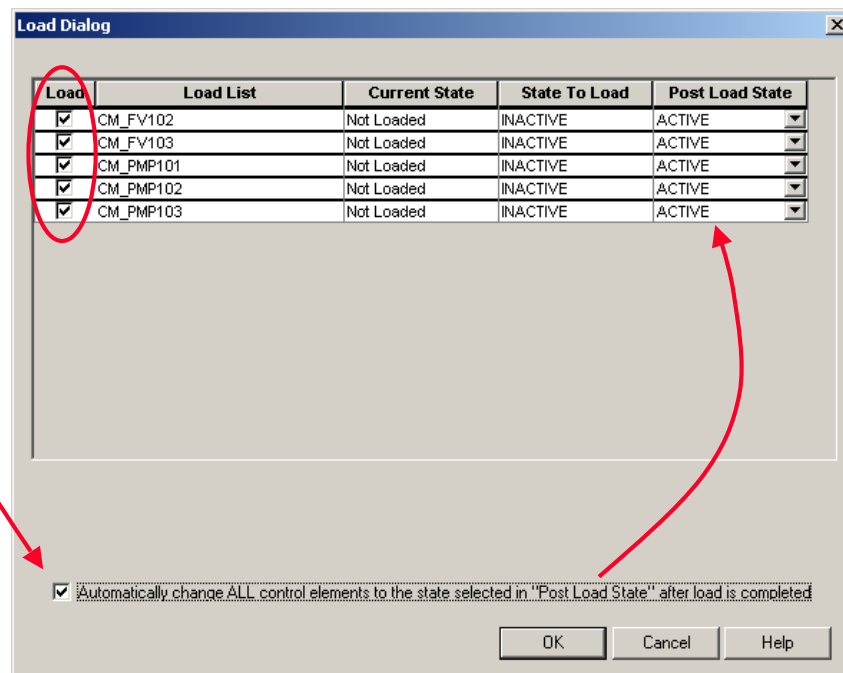

Normally the names and descriptions could be anything you like. For this training it is important that the names be exactly as shown in the table. Any difference in the names will cause the SCMs constructed in later Lessons, along with supplied custom graphics for operations, not to work.

**Honeywell**

## Load and Activate CMs

- Load and Activate the added Device Control Modules

4 - 31

## Notes

### Load and Activate CMs

Clicking on all the added CMs in the Project tree will allow you to load them all at once. This can prove to be quite time saving. Select all the CMs you wish to load, then click the down-arrow.

In the resulting Load Dialog box, make sure the Load check-box for each CM is checked. Also, if you wish to activate the CMs automatically after loading, check the box at the bottom of the Dialog and select ACTIVE as the Post Load State.

## Honeywell

### Verify CMs

- Construct Groups #3 and #4 in Station
- **Group #3**
  - Name           TRANSFER # A & B
  - Slot 1          CM#\_FV101
  - Slot 2          Blank
  - Slot 3          CM#\_PMP101
  - Slot 4          Blank
  - Slot 5          CM#\_FV102
  - Slot 6          CM#\_PMP102
  - Slot 7          Blank
  - Slot 8          Blank
- **Group #4**
  - Name           DRAIN #
  - Slot 1          CM#\_FV103
  - Slot 2          CM#\_PMP103
  - Slot 3          CM#\_AGIT101
  - Slot 4          Blank
  - Slot 5          Blank
  - Slot 6          Blank
  - Slot 7          Blank
  - Slot 8          Blank
- Verify that Pumps & Valves are operational.

4 - 32

## Unit 4 Exam

| QuesNo | Question                                                                                                                                                                                                                                                                     |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1      | <p>The device control CM provides a user interface to the digital I/O used to control a device such as a pump, a motor, or a solenoid valve.</p> <p>A True</p> <p>B False</p>                                                                                                |
| 2      | <p>Device control CMs can be interlocked to prevent operation under configurable process situations.</p> <p>A True</p> <p>B False</p>                                                                                                                                        |
| 3      | <p>Device control CMs can be operated from Station detail displays ( if they are not interlocked and the mode attribute is set to operator ) by manipulating which parameter(s)?</p> <p>A PV</p> <p>B OP</p> <p>C COMMAND</p> <p>D Bad PV Alarm Priority</p>                 |
| 4      | <p>When a device control CM is copied to make a second similar CM, which item(s) are not copied to the new CM?</p> <p>A I/O channel configuration</p> <p>B Alarm configuration</p> <p>C State assignment names and configuration</p> <p>D Server parameter configuration</p> |

- 5        When a device control CM is copied to make a second similar CM, which item(s) are not copied to the new CM?
- A        Function block names
  - B        Parameter connections
  - C        CM name
  - D        Engineering units
- 
- 6        Device control alarms are configured to monitor operation of the device. Which of the following are device control alarms?
- A        Command fail
  - B        Command disagree
  - C        PVHI
  - D        OPHI

# **Unit 5**

## **Creating Auxiliary CMs**

---

**Honeywell**

---

# **PlantScape Controller Implementation**

## **Lesson 1**

### **Configuring a Regulatory Control CM (with simulated I/O)**

---

5 - 3

---

#### **Notes**

#### **Introduction**

The purpose of this Lesson is to give you the knowledge to be able to create and configure a regulatory control CM with simulated I/O. After you complete this Lesson you will have configured a regulatory control valve to control the flow of tank A into the reactor.

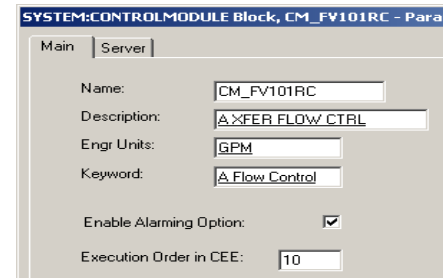

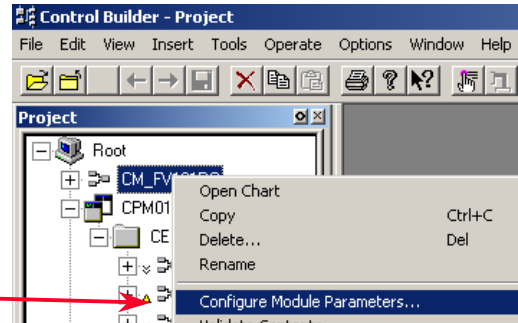

#### **Objectives**

- ❶ Create a new CM named **CM#\_FV101RC**
- ❷ Modify the CM as needed to control the flow of tank A to the reactor
- ❸ Operate your newly created CM from station

## Adding and Configuring a New CM

- Copy CM#\_FIC101
- Name the new CM: CM#\_FV101RC
- Select then right click on the new CM
- Select
  - **Configure Parameters**
- Modify the settings to match the information below:
  - **Main Tab**
    - Name **CM#\_FV101RC**
    - Description **A XFER FLOW CTRL**
    - Engr Units **GPM**
    - Keyword **A FLOW CONTROL**
- Click **OK**
- Assign CM#\_FV101RC to CEE0101

5 - 4

## Notes

### Adding and Configuring a New CM

Before any Function Blocks are inserted to the CM it is good practice to assign the CM to the corresponding CEE. This will enable you to completely configure the I O Channel Function Blocks without having to close and reopen the CM.

**Honeywell**

## Modifying CM#\_FV101RC

- Open CM#\_FV101RC
- Delete the following soft-wire connections: **AICHANNEL** to **DATAACQ**;  
**PID** to **AOCHANNEL**
- Delete the following blocks\*
  - **AICHANNEL**
  - **AOCHANNEL**
- Arrange blocks as shown below

5 - 5

## Notes

### Modifying for Soft Wired Output-to-Input Simulation

CM#\_FIC101 used real IO with the analog outputs hard wired to the analog inputs. In this exercise, we demonstrate a different method of simulation.

\* Here we will use soft wiring to connect output to input. This method is convenient to use because it requires no real IO modules.

Modifying CM#\_FV101RC ...continued

- Double click on the **DACA** Function Block and change the following settings on the **Main** tab

- PVEU Range Hi           **100**
- PVEU Range Lo       **0**
- PV Limits Hi           **100**
- PV Limits Lo          **0**

|                     |                                  |
|---------------------|----------------------------------|
| PVEU Range Hi :     | <input type="text" value="100"/> |
| PVEU Range Lo :     | <input type="text" value="0"/>   |
| PV Limits Hi :      | <input type="text" value="100"/> |
| PV Limits Lo :      | <input type="text" value="0"/>   |
| Low Signal Cut Off: | <input type="text" value="NaN"/> |

- Double click on the **DACA** Function Block and change the following settings on the **Alarms** tab

- PV High High           **95**       **Urgent**       **0**
- PV High               **85**       **High**       **0**

|                |                                 |                                     |                                |
|----------------|---------------------------------|-------------------------------------|--------------------------------|
| Alarm Limits   | Trip Point                      | Priority                            | Severity                       |
| PV High High : | <input type="text" value="95"/> | <input type="text" value="URGENT"/> | <input type="text" value="0"/> |
| PV High :      | <input type="text" value="85"/> | <input type="text" value="HIGH"/>   | <input type="text" value="0"/> |

5 - 6

Notes

Modifying CM#\_FV101RC ...continued

- Double click on the **PIDA** Function Block and change the following settings:

- **Main** tab
  - PVEU Range Hi           **100**
  - PVEU Range Low       **0**
  - Manual PV Option       **NO\_SHED**

- **SetPoint** Tab
  - High limit           **100**
  - Low limit           **0**

5 - 7

Notes

|  |
|--|
|  |
|  |
|  |
|  |
|  |
|  |
|  |
|  |
|  |
|  |
|  |
|  |

## Modifying CM#\_FV101RC ...continued

- Wire the blocks together in this manner
- Close and save changes to CM#\_FV101RC
- **Load and Activate CM#\_FV101RC**

- In Station, add CM#\_FV101RC to Group #3, Slot 2 and verify that it is operational

5 - 8

## Notes

### Simulating IO

By soft-wiring the OP from the PID block to the Input (P1) of the DATAACQ block, we are simulating having real IO.

**PlantScape Controller Implementation**

**Lesson 1**

**Configuring a Regulatory Control CM  
(With Simulated IO)**

5 - 9

**Notes**

---

---

**Honeywell**

# **PlantScape Controller Implementation**

## **Lesson 2**

### **Configuring a Flow Totalizer**

---

5 - 11

---

#### **Notes**

#### **Introduction**

The purpose of this Lesson is to give you the knowledge to be able to create and configure a flow totalizer CM. After you complete this Lesson you will have configured the Totalizer Block that will keep running totals of all flows in the project.

#### **Objectives**

- ❶ Create a new CM named CM#\_ACCA to totalize flows into and out of the reactor
- ❷ Add and configure TOTALIZER Function Blocks
- ❸ Add NUMERIC and SELREAL Function Blocks to simulate flow rates

## Honeywell

### Adding and Configuring a new CM

- Create a new CM
- Modify the settings to match the information below

– **Main** tab

- Name **CM#\_ACCA**
- Description **TANK TOTALIZERS**
- Engr Units **GAL**
- Keyword **TANK TOTALS**
- Execution Period **200ms**

|                 |                         |
|-----------------|-------------------------|
| CM#_ACCA        | Execution Period: 200ms |
| TANK TOTALIZERS | Execution Phase: -1     |
| GAL             | Unit Text:              |
| TANK TOTALS     | Version:                |

– **Server** Tab

- Point Detail Page **sysDtlACCA.dsp \***
- Group Detail Page **sysGrpACCA.dsp \***
- Control Area **A#**

|                    |                |
|--------------------|----------------|
| Point Detail Page  | sysDtlACCA.dsp |
| Associated Display |                |
| Group Detail Page  | sysGrpACCA.dsp |
| Control Level      | 200            |
| Control Area       | A1             |

- Close **CM#\_ACCA** and save changes
- Assign **CM#\_ACCA** to **CEE0101**

5 - 12

## Notes

### Adding and Configuring a new CM

When adding a new CM you can use any one of the following three methods

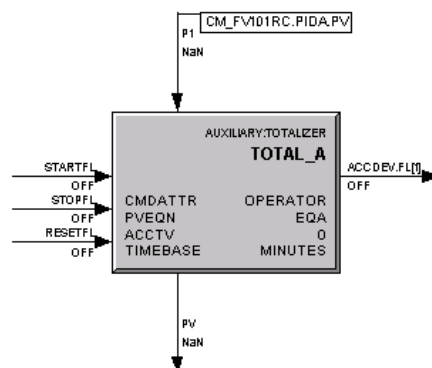

- Click File > New > Control Module
- Drag a CM from the Library Tab to the Project Tab
- Double click on the CM in the Library Tab (This method adds the CM to the Project and opens the chart for configuration, in one step. It also allows more work area since only one tree needs to be open.)

\* Note: sysDtlACCA.dsp and sysGrpACCA.dsp are not standard detail and group displays. They were modified from standard detail and group displays for this course.

## Honeywell

### Adding and Configuring Function Blocks (Tank A)

- Open **CM#\_ACCA**
- Add a **TOTALIZER** Block (Under **AUXILIARY** category in Library)
- Double click on the **TOTALIZER** Function Block
- Modify the settings to match the information below
  - Name **TOTAL\_A**
  - Description **TANK A FLOW TOTAL**
- Add a Parameter Connector to the **P1** Pin
  - **CM#\_FV101RC.PIDA.PV**
- Enter, or use the point selector tool, to add Parameter Connector Information
  - **CM#\_FV101RC.PIDA.PV**

5 - 13

## Notes

### Adding and Configuring Function Blocks (Tank A)

The Tank A totalizer will have a different configuration than those for Tank B and the Reactor. Tank A has a Regulatory Control valve, CM#\_FV101RC, in its transfer line. Tank B and the Reactor have only 2-State valves. The regulatory control valve allows the totalizer block to read the flow directly from PIDA.PV in CM#\_FV101RC.

For more information on how to configure and use TOTALIZER function blocks refer to the *Control Builder Components Theory, Auxiliary Function, TOTALIZER Block*.

## Honeywell

### Adding and Configuring Function Blocks (Tank B)

- Add a second **TOTALIZER** Function Block
- Modify the settings to match the information below
  - Name **TOTAL\_B**
  - Description **TANK B FLOW TOTAL**

- To simulate a flow\*, add a **SELREAL** (logic) Function Block
  - Modify the settings to match the information below

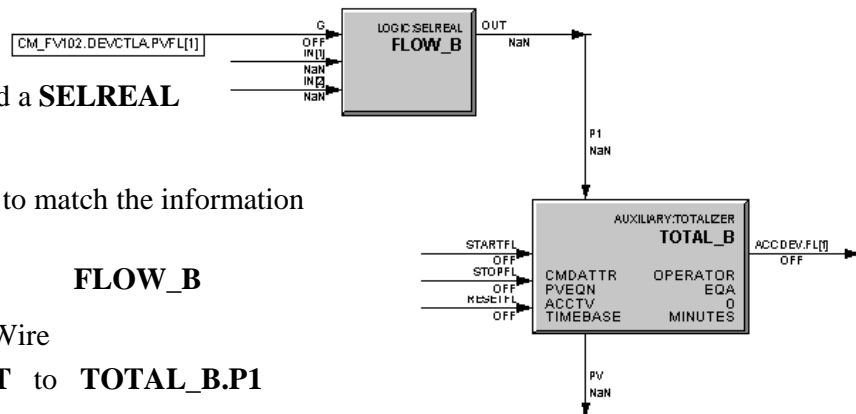

Name **FLOW\_B**

- Add the following Wire

**FLOW\_B.OUT** to **TOTAL\_B.P1**

- Add a Parameter Connector as shown above: **CM#\_FV102.DEVCTLA.PVFL[1]**

Note: The point selector tool only has PVFL[0] in its parameter list. Select the PVFL[0] parameter and then edit the parameter connector to PVFL[1]

5 - 14

## Notes

### Adding and Configuring Function Blocks (Tank B)

\* In the configuration of Tank B's totalizer we add a SELREAL Block to simulate a flow input to the TOTAL\_B Block. In the SELREAL Block, when the value of the parameter connector becomes true (FV102 is opened), the OUT real value will be set to (IN[2]). When the parameter connector becomes false (CM#\_FV102 is closed), the OUT real value will be set to (IN[1]).

In a real world situation, we would have an Analog Input Channel block supplying the actual flow rate.

For more information on how to configure and use SELREAL function blocks refer to the *Control Builder Components Theory, Logic Function, SELREAL Block*.

## Honeywell

### Adding and Configuring Function Blocks (Tank B)

- To aid in the flow simulation, add two **NUMERIC** blocks
- Modify the settings to match the information below
  - Name Block 1 **CLOSED\_FLOW**
  - Name Block 2 **OPEN\_FLOW**
- Configure **CLOSED\_FLOW**:

|                   |                                          |
|-------------------|------------------------------------------|
| Name              | <input type="text" value="CLOSED_FLOW"/> |
| Access Lock       | <input type="text" value="OPERATOR"/>    |
| PV High Limit     | <input type="text" value="5"/>           |
| PV Low Limit      | <input type="text" value="0"/>           |
| Actual Value      | <input type="text" value="0"/>           |
| PV Display Format | <input type="text" value="D1"/>          |

- Configure **OPEN\_FLOW**:

|                   |                                        |
|-------------------|----------------------------------------|
| Name              | <input type="text" value="OPEN_FLOW"/> |
| Access Lock       | <input type="text" value="OPERATOR"/>  |
| PV High Limit     | <input type="text" value="100"/>       |
| PV Low Limit      | <input type="text" value="0"/>         |
| Actual Value      | <input type="text" value="80"/>        |
| PV Display Format | <input type="text" value="D1"/>        |

5 - 15

## Notes

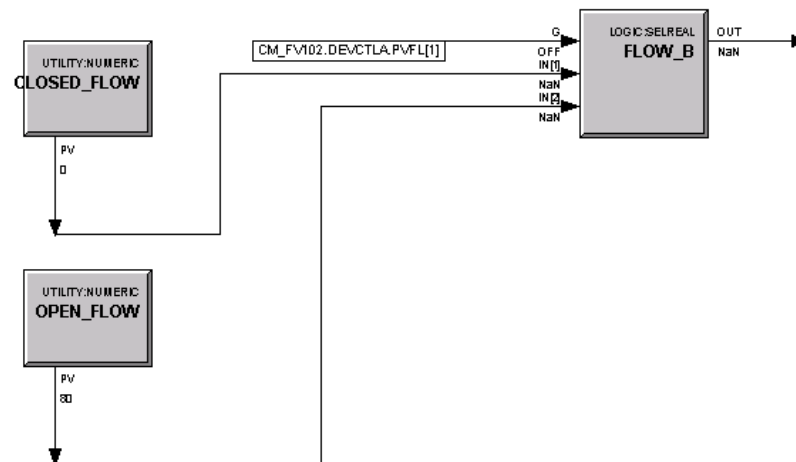

### Adding and Configuring Function Blocks (Tank B)

The inputs to the **SELREAL** Function Block cannot be added in project. Therefore we are using two **NUMERIC** blocks. One (**CLOSED\_FLOW**) will be used for flow when the valve is closed. It will be set to **0.0**. The other (**OPEN\_FLOW**) will be used for flow when the valve is open. It will be set to **80.0**. (**D1** for the PV Display Format sets up 1 decimal place.)

## Honeywell

### Adding and Configuring Function Blocks (Tank B)

- Wire the **NUMERIC** blocks to the two inputs of the **SELREAL** block as shown

5 - 16

### Notes

#### Adding and Configuring Function Blocks (Tank B)

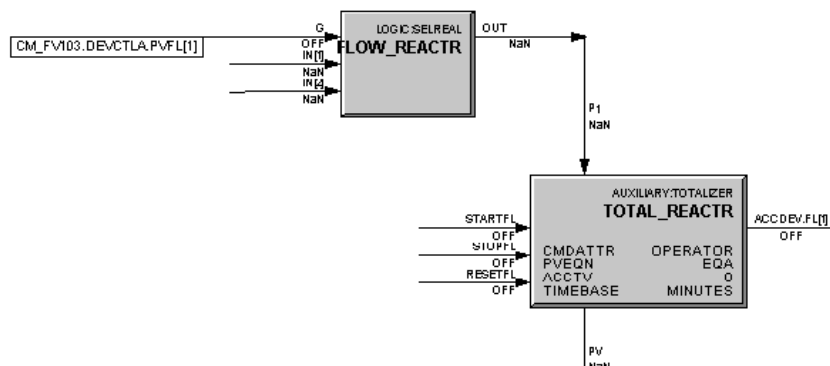

Now in the **SELREAL** Block, when the value of the parameter connector becomes true (FV102 is opened), the **OUT** value will be set to to flow rate (**IN[2]**) or 80.0. When the parameter connector becomes false (CM#\_FV102 is closed), the **OUT** value will be set to (**IN[1]**) or 0.0 .

## Honeywell

### Adding and Configuring Function Blocks (Reactor Drain)

- The configuration of the Reactor Drain totalizer is identical in concept to that of the Ingredient B totalizer.
- Add the blocks and configure them as shown
  - Note that the block names drop the “o” in reactor

- Use the same **NUMERIC** blocks we used for the **FLOW\_B** simulation for reactor flow simulation
- The finished CM is shown on the next page

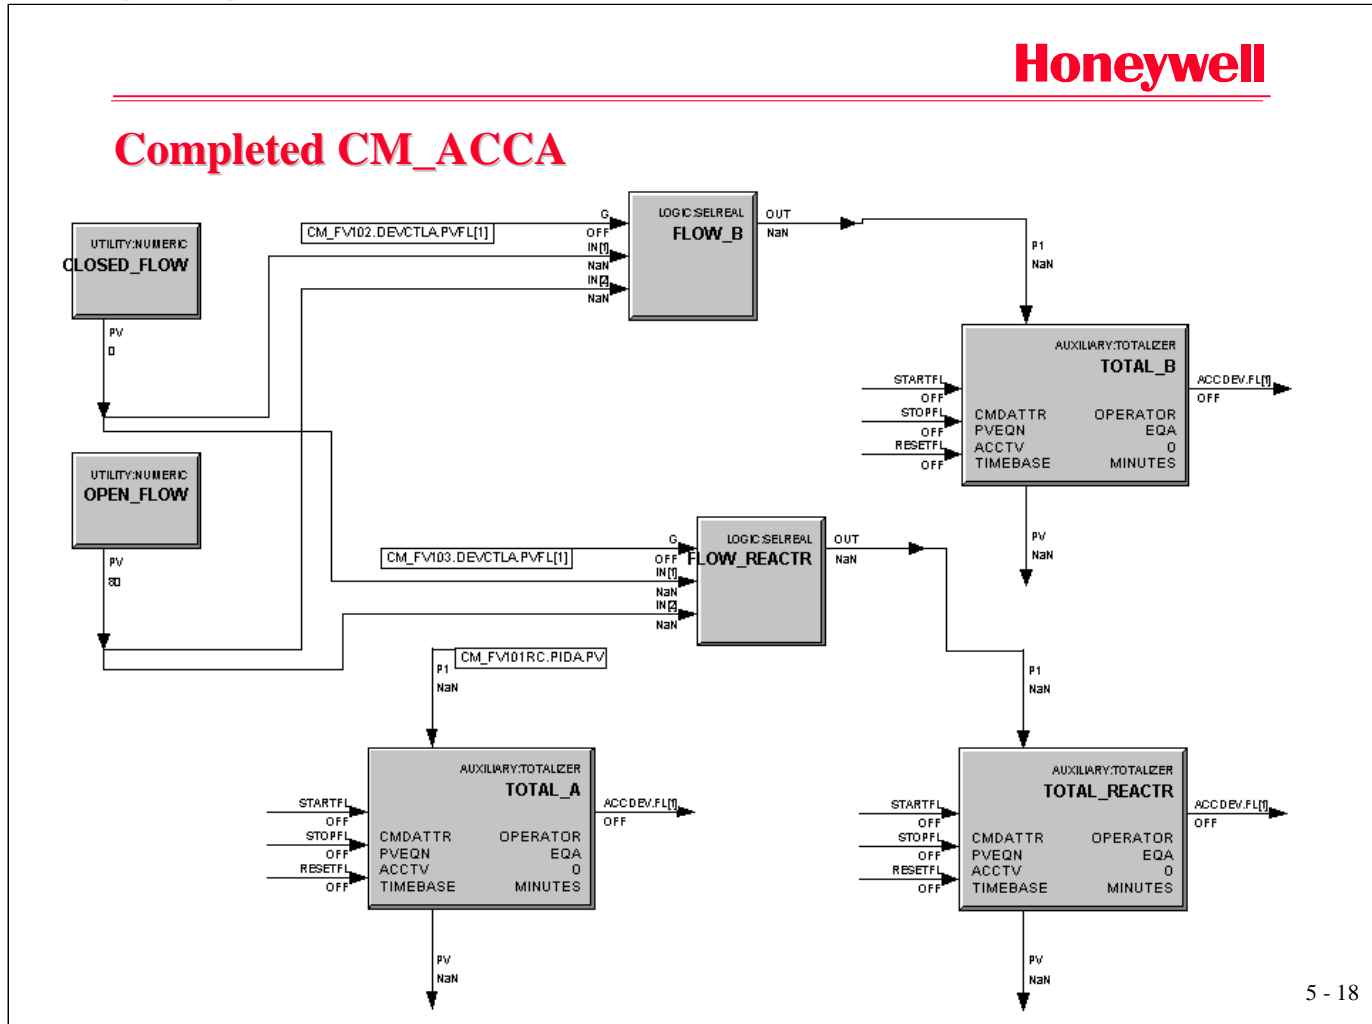

5 - 17

## Notes

### Adding and Configuring Function Blocks (Reactor)

Just as we did in the configuration of the Tank B totalizer, we add a SELREAL Block and use the FLOW\_CLOSED and FLOW\_OPEN NUMERIC blocks to simulate a flow to the TOTAL\_REACTR Block.

In a real world situation, we would have an Analog Input Channel block supplying the actual flow rate.

## Notes

### Completed CM

Note that in this CM there are three non-related, unconnected functions: the totalizers for Tank A; for Tank B; and for the Reactor. A CM can contain up to 40 function blocks. The blocks may or may not be related to each other.

Since the configuration of a CM is essentially anything you want it to be, for many of your configurations there will be no supplied Station Detail Display. In those instances, you can modify a supplied display or create your own.

The detail and group displays for this CM for the class were created by modifying the detail and group displays for the PID CM type.

**Honeywell**

## **Finish CM\_ACCA**

- Close and save **CM#\_ACCA**
- **Load** and **Activate** **CM#\_ACCA**
- Note: After every load of a **TOTALIZER** block, it must be **RESET** to get a 0.0 accumulated value (**PV**) instead of NaN, and a PV status (**PVSTS**) of NORMAL instead of BAD. We will **RESET** the three totalizer blocks in **CM\_ACCA** prior to using them.

5 - 19

## **Notes**

|  |
|--|
|  |
|  |
|  |
|  |
|  |
|  |
|  |
|  |
|  |
|  |
|  |
|  |

## Honeywell

### Improve Ingredient A Totalizer (Optional)

- While the Ingredient A totalizer will work as configured, it ignores the Tank A valve **CM#\_FV101**. Because the totalizer only uses the **PV** of **CM#\_FV101RC** which has has Output-to- Input configuration, **CM#\_FV101** can be closed while the Ingredient A totalizer continues to accumulate.
- If we bring in the status of **CM#\_FV101** into the totalizer scheme, the project will be more realistic.
  - How can we do this? Consult with your course manager on your own idea, or use one of the solutions shown on the next pages.

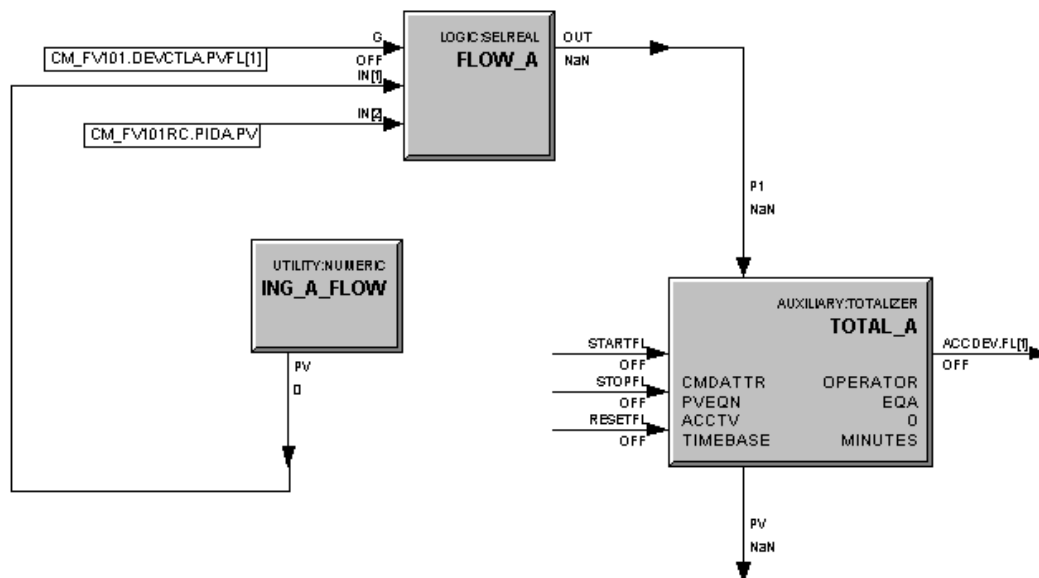

5 - 20

### Notes

## Honeywell

### Improve Ingredient A Totalizer (Optional)

- One solution uses a **SELREAL** block and a **NUMERIC** block to select either the **PV** of **CM#\_FV101RC** or zero as the input to the Tank A totalizer, depending on whether **CM#\_FV101** is open or closed

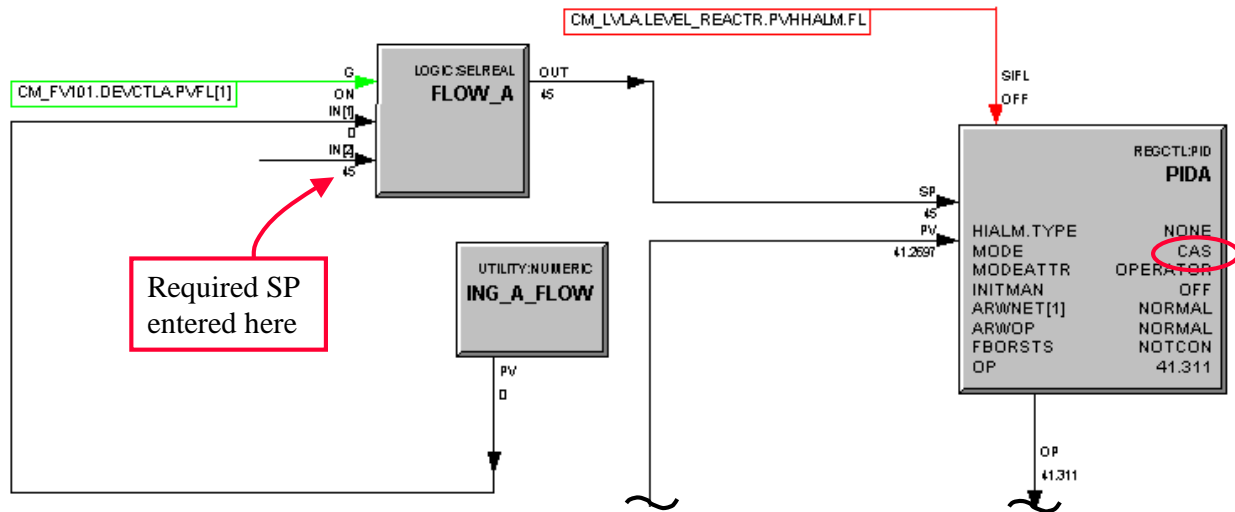

5 - 21

### Notes

## Honeywell

### Improve Ingredient A Totalizer (Optional)

- A second solution uses the same concept: a **SELREAL** block and a **NUMERIC** block to select either the entered **SP** (**IN[2]**) or zero, depending on whether **CM#\_FV101** is open or closed. Here we connect the selected output to the **SP** of the **PID** block of **CM#FV101RC**. In this solution we leave the A totalizer as originally configured. We also assume that **CM#\_FV101RC** is kept in **CAS** mode to select the remote **SP**.

5 - 22

## Notes

### Solution 2 Information

Note that in this solution, it will take some time for the flow to go to zero. It still may be preferable to put the valve in **MANUAL** and set the **OP** to zero for fast action.

For the operator interface, you would need to add a data entry port for the **IN[2]** parameter if **SP** changes are to be available for changing from the Detail display. Also note that **IN[2]** goes to NaN (Not a Number) after a download.

## Honeywell

### Improve Ingredient B and Reactor Totalizers (Optional)

- While the Ingredient B and Reactor totalizers will work as configured, they ignore the respective inline pumps.
- If we bring in the status of **CM#\_PMP102** and **PMP#\_103** into the totalizer schemes, the project will be more realistic.
  - How can we do this? Consult with your course manager on your own idea, or use the solution shown on the next page.

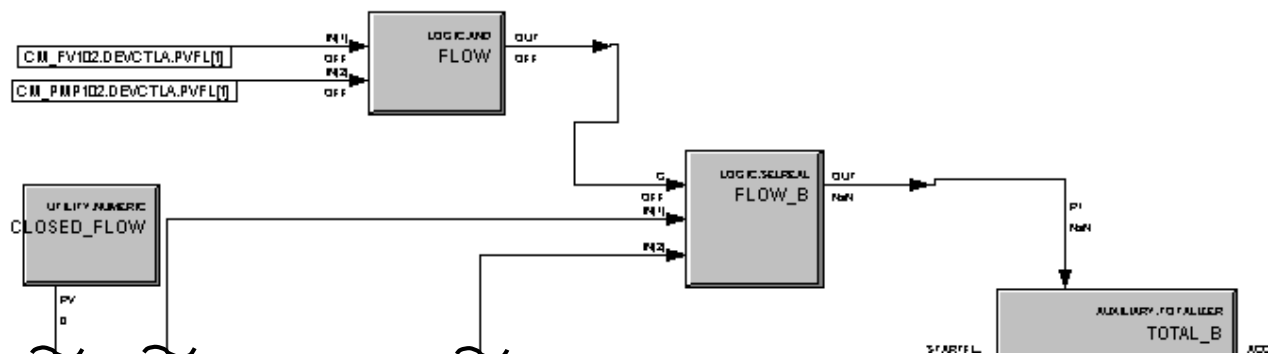

5 - 23

### Notes

## Honeywell

### Improve Ingredient B and Reactor Totalizers (Optional)

- One solution uses an **AND** block with two parameter connections to the status of both the valve and pump for Ingredient B and for the Reactor Drain. With this configuration, the valve must be open and its inline pump on for the **SELREAL** block to select 80 as the input to the totalizer. The Ingredient B configuration is shown below. The Reactor Drain would be similar.

5 - 24

## Notes

**Honeywell**

## **Finish CM\_ACCA**

- Close and save **CM#\_ACCA**
- **Load** and **Activate** **CM#\_ACCA**
- Note: After every load of a **TOTALIZER** block, it must be **RESET** to get a 0.0 accumulated value (**PV**) instead of NaN, and a PV status (**PVSTS**) of NORMAL instead of BAD. We will **RESET** the three totalizer blocks in **CM\_ACCA** prior to using them.

5 - 25

**Honeywell**

# **PlantScape Controller Implementation**

## **Lesson 3**

### **Building Level Indicators**

---

5 - 27

---

#### **Notes**

#### **Introduction**

The purpose of this lesson is to give you the knowledge to be able to create and configure a level indicator. After you complete this lesson you will have configured the CM that will calculate the levels of material in Tank A, Tank B, and the Reactor.

#### **Objectives**

- ❶ Create a new CM named CM#\_LVLA to calculate material levels
- ❷ Add and configure AUXCALC and DATAACQ Function Blocks
- ❸ Operate CM#\_LVLA and CM#\_ACCA in Station

## Honeywell

### Adding and Configuring a new CM

- Create a new CM
- Modify the settings to match the information below
  - **Main** tab
    - Name **CM#\_LVLA**
    - Description **TANKS LEVEL INDICATORS**
    - Engr Units **GAL**
    - Keyword **TANK LEVELS**
    - Execution Period **200MS**
  - **Server** Tab
    - Point Detail Page **sysDtlLVLA.dsp\***
    - Group Detail Page **sysGrpLVLA.dsp\***
    - Control Area **A#**
- Close **CM#\_LVLA** and save changes
- Assign **CM#\_LVLA** to **CEE0101**

|              |                                                     |
|--------------|-----------------------------------------------------|
| Name:        | <input type="text" value="CM_LVLA"/>                |
| Description: | <input type="text" value="TANKS LEVEL INDICATORS"/> |
| Engr Units:  | <input type="text" value="GAL"/>                    |
| Keyword:     | <input type="text" value="TANK LEVELS"/>            |

5 - 28

## Notes

### Adding and Configuring a new CM

When adding a new CM you can use any one of the following three methods:

- Click File > New > Control Module
- Drag a CM from the Library Tab to the Project Tab
- Double click on the CM in the Library Tab (This method adds the CM to the Project and opens the chart for configuration, in one step. It also allows more work area since only one tree needs to be open.)

\* Note: sysDtlLVLA.dsp and sysGrpLVLA.dsp are not standard detail and group displays. They were modified from standard detail and group displays for this course.

Before any Function Blocks are inserted to the CM it is good practice to assign the CM to the corresponding CEE. This will enable you to completely configure the I/O Channel Function Blocks without having to close and reopen the CM.

## Honeywell

### Adding and Configuring Function Blocks (Tank A)

- Open **CM#\_LVLA**
- Add an **AUXCALC** Function Block
- Double click on the **AUXCALC** Block
- Modify the settings to match the information below
  - Name **LVLCALC\_A**
  - Description **LEVEL CALC FOR TANK A**
  - Assignable Outputs **PV C[1]**

- Add a new Pin to the **LVLCALC\_A** Block
  - P[1] Input/Top

Name: LVLCALC\_A

Description: LEVEL CALC FOR TANK A

Assignable Outputs

PV: C[1]

5 - 29

## Notes

### Adding and Configuring Function Blocks (Tank A)

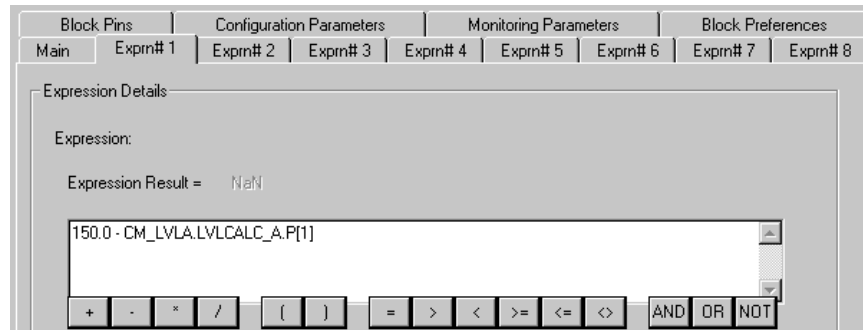

Configuring the AUXCALC Block is different from any other block configured in previous lessons. The PV is the result of any of the block functions that the user chooses. In this case, we choose C1, which is the result of calculation 1.

The AUXCALC will use a Parameter Connection for its input. That is why we are adding a new pin at this point. To add a new pin, enter the Block Configuration screen and select the type of input and position for the pin.

**Honeywell**

## Adding and Configuring Function Blocks (Tank A) ...continued

- Add a Parameter Connector to the **P[1]** Pin
- Enter Parameter Connector Information
  - **CM#\_ACCA.TOTAL\_A.PV**
- Double click on the **LVLCALC\_A** Block
- Click on the Exprn#1 tab and enter the following information  
**150.0 - CM#\_LVLA.LVLCALC\_A.P[1]**
- Click **OK**

5 - 30

## Notes

### Configuring Expression Details

Expression 1 will calculate the level in Tank A. Tanks A and B have capacities of 150 Gallons each. We are subtracting the A flow totalizer amount from 150 to calculate the level. Recall that each time the process starts, both A and B are refilled.

Notice that the AUXCALC has access to the entire database in the expression syntax. We did not have to bring in CM#\_ACCA.TOTAL\_A.PV as an input to the block. We could have referenced it directly in the expression. We added it as an input so that it would be visible from the chart drawing

Adding and Configuring Function Blocks (Tank A) ...continued

- Add a **DATAACQ** Block
- Configure the **DATAACQ** with the following information
  - **Main** Tab
    - Name **LEVEL\_A**
    - Description **LEVEL IN TANK A**
    - Engr units **GAL**
    - PVEU Range Hi **150**
    - PVEU Range Lo **0**
    - PV Limits Hi **150**
    - PV Limits Lo **0**
    - Clamping/Filtering **Clamping Enabled**

|                     |                                  |
|---------------------|----------------------------------|
| PVEU Range Hi :     | <input type="text" value="150"/> |
| PVEU Range Lo :     | <input type="text" value="0"/>   |
| PV Limits Hi :      | <input type="text" value="150"/> |
| PV Limits Lo :      | <input type="text" value="0"/>   |
| Low Signal Cut Off: | <input type="text" value="NaN"/> |

|                     |                          |                        |                        |
|---------------------|--------------------------|------------------------|------------------------|
| – <b>Alarms</b> Tab |                          |                        |                        |
|                     | <u><b>Trip Point</b></u> | <u><b>Priority</b></u> | <u><b>Severity</b></u> |
| <b>PV Low</b>       | <b>5</b>                 | <b>High</b>            | <b>0</b>               |

5 - 31

Notes

Adding a Data Acquisition Block

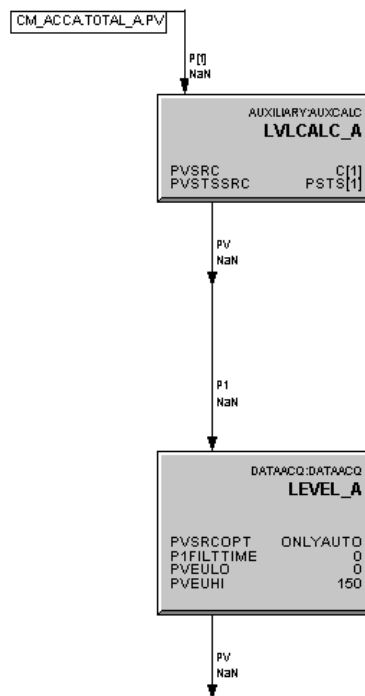

We are using the DATAACQ block for similar reasons that we used it in the PID loop -- namely for High and Low alarming. ( In this case we are only concerned with the low alarm.)

We are adding it for another reason as well. We want to indicate the tank level in a display. The Display Builder Indicator uses percent parameters for its input. The DATAACQ block has a parameter PVP, which is PV in percent. This is the parameter we will use in the display.

**Honeywell**

## Adding and Configuring Function Blocks (Tank A) ...continued

- Wire
  - LVLCALC\_A.PV
  - to
  - LEVEL\_A.P1

5 - 32

## Notes

## Honeywell

### Adding and Configuring Function Blocks (Tank B) ...continued

- Add a second **AUXCALC** Function Block
- Double click on this **AUXCALC** Block
- Modify the settings to match the information below
  - Name **LVLCALC\_B**
  - Description **LEVEL CALC FOR TANK B**
  - Assignable Outputs **PV: C[1]**

Name: LVLCALC\_B

Description: LEVEL CALC FOR TANK B

Assignable Outputs

PV: C[1]

- Add a new Pin to the **LVLCALC\_B** Block
  - **P[1] Input/Top**

5 - 33

## Notes

### Adding and Configuring Function Blocks (Tank B)

This AUXCALC block will be used to calculate the level in Tank B. Its configuration will be nearly identical to that for Tank A.

## Honeywell

### Adding and Configuring Function Blocks (Tank B) ...continued

- Add a Parameter Connector to the **P1** Pin
- Enter Parameter Connector Information
  - **CM#\_ACCA.TOTAL\_B.PV**
- Double click on the **LVLCALC\_B** Block
- Click on the Exprn#1 tab and enter the following information
  - 150.0 - CM#\_LVLA.LVLCALC\_B.P[1]**
- Click **OK**

Expression:  
Expression Result = NaN  
150.0 - CM\_LVLA.LVLCALC\_B.P[1]

5 - 34

## Notes

### AUXCALC Expressions

Note that the AUXCALC block can have up to eight expressions. The result of each is C1 through C8. The expressions can use inputs from the block's own controller database or that of any other controller on the Supervisory C-Net through peer-to-peer connections. The expressions have many math functions available and the results can be used through out the control scheme.

The AUXCALC has a counterpart in the Regulatory Control family. It is called the REGCALC block. In the reference below, Table 1 lists the math functions available for both the AUXCALC and the REGCALC blocks.

For more information on configuring REGCALC blocks refer to the *Control Builder Components Theory, Regulatory Control, REGCALC Block*.

Adding and Configuring Function Blocks (Tank B) ...continued

- Add a **DATAACQ** Block
- Configure the **DATAACQ** with the following information
  - **Main** Tab
    - Name **LEVEL\_B**
    - Description **LEVEL IN TANK B**
    - Engr units **GAL**
    - PVEU Range Hi **150**
    - PVEU Range Lo **0**
    - PV Limits Hi **150**
    - PV Limits Lo **0**
    - Clamping/Filtering **Clamping Enabled**

|                     |                                  |
|---------------------|----------------------------------|
| PVEU Range Hi :     | <input type="text" value="150"/> |
| PVEU Range Lo :     | <input type="text" value="0"/>   |
| PV Limits Hi :      | <input type="text" value="150"/> |
| PV Limits Lo :      | <input type="text" value="0"/>   |
| Low Signal Cut Off: | <input type="text" value="NaN"/> |

- **Alarms** Tab

|          | <u>Trip Point</u> | <u>Priority</u> | <u>Severity</u> |
|----------|-------------------|-----------------|-----------------|
| • PV Low | <b>5</b>          | <b>High</b>     | <b>0</b>        |

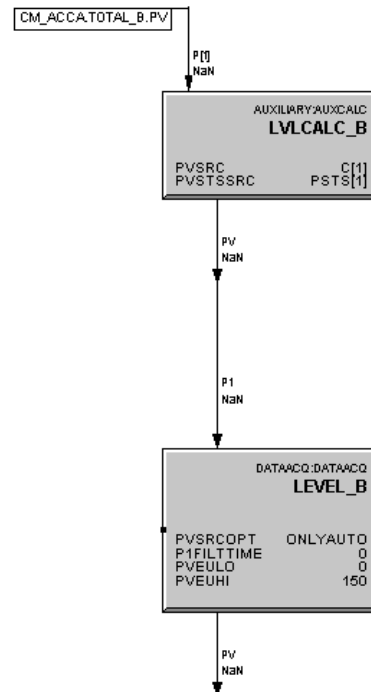

5 - 35

Notes

## Adding and Configuring Function Blocks (Tank B) ...continued

- Wire
  - **LVLALC\_B.PV**  
to  
**LEVEL\_B. P1**

5 - 36

## Notes

[illegible]

**Honeywell**

## **Adding and Configuring Function Blocks (Reactor) ...continued**

- Add a third **AUXCALC** Block
- Configure the **AUXCALC** with the following information
  - **Main Tab**
    - Name **LVLCALC\_REACTR**
    - Description **LEVEL FOR REACTOR**
    - Assignable Outputs **PV: C[1]**
  - **Exprn 1 Tab**  
$$\text{CM\#\_ACCA.TOTAL\_A.PV} + \text{CM\#\_ACCA.TOTAL\_B.PV} - \text{CM\#\_ACCA.TOTAL\_REACTR.PV}$$

- Add three new Pins to the **LVLCALC\_REACTR** Block
  - P[1] Input/Left
  - P[2] Input/Left
  - P[3] Input/Left

5 - 37

## **Notes**

### **Level for Reactor**

This AUXCALC block will calculate the level in the reactor. It totals the Tank A and Tank B charge amounts and subtracts the Reactor drain flow total.

---

---

---

---

---

---

## Honeywell

### Adding and Configuring Function Blocks (Reactor) ...continued

- Add a Parameter Connector to the **P1** Pin
- Enter Parameter Connector Information
  - **CM#\_ACCA.TOTAL\_A.PV**
- Add a Parameter Connector to the **P2** Pin
- Enter Parameter Connector Information
  - **CM#\_ACCA.TOTAL\_B.PV**
- Add a Parameter Connector to the **P3** Pin
- Enter Parameter Connector Information
  - **CM#\_ACCA.TOTAL\_REACTR.PV**

5 - 38

## Notes

### Parameter Connections

Since the AUXCALC expression uses the amounts from the Tank A, Tank B, and Reactor totalizers directly, these parameter connectors are for chart reference only.

Because we did add them as parameter inputs, the expression could be alternatively written:  
$$\text{CM\#\_LVLA.LVLCALC\_REACTR.P[1]} + \text{CM\#\_LVLA.LVLCALC\_REACTR.P[2]} - \text{CM\#\_LVLA.LVLCALC\_REACTR.P[3]}$$

Honeywell

Adding and Configuring Function Blocks (Reactor) ...continued

- Add a **DATAACQ** Block
- Configure the **DATAACQ** with the following information

– **Main Tab**

- Name **LEVEL\_REACTR**
- Description **LEVEL IN REACTOR**
- Engr units **GAL**
- PVEU Range Hi **320**
- PVEU Range Lo **0**
- PV Limits Hi **320**
- PV Limits Lo **0**
- Clamping/Filtering **Clamping Enabled**

|                     |                                  |
|---------------------|----------------------------------|
| PVEU Range Hi :     | <input type="text" value="320"/> |
| PVEU Range Lo :     | <input type="text" value="0"/>   |
| PV Limits Hi :      | <input type="text" value="320"/> |
| PV Limits Lo :      | <input type="text" value="0"/>   |
| Low Signal Cut Off: | <input type="text" value="NaN"/> |

– **Alarms Tab**

|              | <u>Trip Point</u> | <u>Priority</u> | <u>Severity</u> |
|--------------|-------------------|-----------------|-----------------|
| PV High High | <b>300</b>        | <b>Urgent</b>   | <b>0</b>        |
| PV High      | <b>280</b>        | <b>Low</b>      | <b>0</b>        |
| PV Low       | <b>10</b>         | <b>Journal</b>  | <b>0</b>        |
| PV Low Low   | <b>5</b>          | <b>Journal</b>  | <b>0</b>        |

5 - 39

Notes

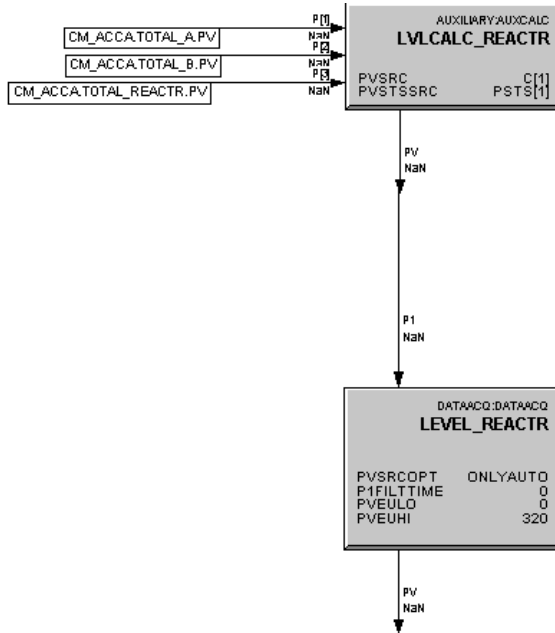

**DATAACQ Block for Reactor Level**

The reactor tank capacity is 320 gallons. The data acquisition block allows alarming and as we will see in the next lesson, interlocking, when the tank approaches full status.

5 - 41

## Notes

### Operating the Control Scheme

- In Station or Control Builder reset and Start the totalizers for A, B, and the Reactor
- In Station open CM#\_FV101 and CM#\_FV102 (Use Groups #2, #3, and #4)
- Set the MODE of CM#\_FV101RC to AUTO and enter 85 for the SP
- Note the CM#\_ACCA totals increasing for A and B, the A and B tank levels decreasing while the Reactor level increases
- Close CM#\_FV101 and CM#\_FV102. Put CM#\_FV101RC in MAN and set the OP to 0.0.
- Open the Drain Valve, CM#\_FV103
- Note the reactor level decreasing
- Close the drain valve when the reactor is empty

# **PlantScape Controller Implementation**

## **Lesson 4**

### **Building a Flag CM**

5 - 43

---

#### **Notes**

##### **Introduction**

The purpose of this Lesson is to give you the knowledge to be able to use Flag function blocks. After you complete this Lesson you will have configured the CM that will allow control of four flags. The flags will be used later in the project, with SCMs.

##### **Objectives**

- ❶ Create a new CM named **CM#\_FLAGS**
- ❷ Add and configure four Flag Function Blocks
- ❸ Operate the flags from Group and Point Detail displays

## Honeywell

### Adding and Configuring a new CM

- Create a new CM
- Modify the settings to match the information below
  - **Main** tab
    - Name **CM#\_FLAGS**
    - Description **FLAGS FOR SCMs**
    - Execution period **200MS**
  - **Server** tab
    - Point Detail Page **sysdtlFLAG.dsp**
    - Group Detail Page **sysgrpFLAG.dsp**
    - Control Area **A#**
- Close **CM#\_FLAGS** and save changes
- Assign **CM#\_FLAGS** to **CEE0101**
- Open **CM#\_FLAGS**
- Add four **Flag** blocks

5 - 44

### Notes

## Honeywell

### Configure Flag Blocks

- Using the information below configure the four **Flag** blocks

| Number | Name     | Off Normal Alarm |
|--------|----------|------------------|
|        |          | Priority         |
| 1      | XFER_A   | NONE             |
| 2      | TEMP     | NONE             |
| 3      | REACTION | NONE             |
| 4      | ING_B    | NONE             |

- Close **CM#\_FLAGS** and save changes
- Load and Activate **CM#\_FLAGS**

5 - 45

### Notes

#### Custom Detail Displays

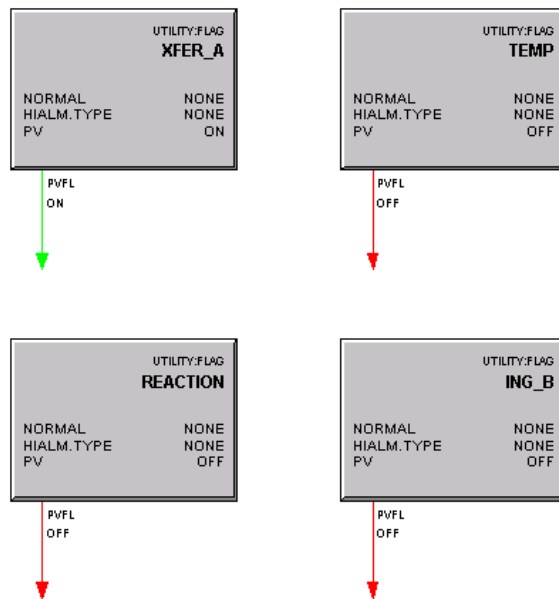

This CM is made up of four unconnected Flag blocks. There is no detail display supplied with PlantScape for this CM. For access to these flags, you could create a Point Detail display, a Group faceplate, and/or a custom display. A Detail display and Group faceplate were created for use in this class.

The only reason to create a separate CM for these flags is for the group faceplate. It is more normal to add flag blocks to existing CMs.

**Honeywell**

## Solution

- Your CM should look similar to the following:

5 - 46

## Notes

## Honeywell

### Operation

- Add **CM#\_FLAGS** to Group #2, Slot 4; Group #4, Slot 6
- To turn a flag on and off, click its check box on and off

5 - 47

### Notes

**Honeywell**

**This completes....**

**PlantScape Controller Implementation**

- 4 In order to use a parameter from a CM in an AUXCALC expression, it must first be brought in as one of the P[1-6] inputs to the AUXCALC block.
- A True
- B False
- 5 The totalizer function block can support up to four intermediate trip points prior to reaching its target value. What is the parameter that goes true as each trip point is reached.
- A PVSTS
- B ACCTVFL
- C STOPFL
- D ACCDEV.FL[1-4]
- 6 The totalizer function block has a parameter that goes true when it reaches its target value. What is this parameter?
- A PVSTS
- B ACCTVFL
- C STOPFL
- D ACCDEV.FL[1-4]

# **Unit 6**

## **Interlocks and Messages**

---

**Honeywell**

---

# **PlantScape Controller Implementation**

## **Lesson 1**

# **Configuring Operational Overrides**

---

6 - 3

---

### **Notes**

#### **Introduction**

The purpose of this Lesson is to give you the knowledge to be able configure operational overrides to interlock Control Modules. After you complete this Lesson you will have interlocked all of the valves and pumps for project operation.

#### **Objectives**

- ❶ Create a new logic CM named CM#\_LK01
- ❷ Add parameter connectors and logic blocks to interlock the valves
- ❸ Use CM#\_LK01 CM to interlock the pumps

**Honeywell**

## Modify Existing CMs to Interlock (CM#\_FV101)

- Select the **Project** tab
- Open **CM#\_FV101**
- Add the following pin to **DEVCTLA**

| Pin | Location   | Array Indices |
|-----|------------|---------------|
| OI  | Input/Left | [0]           |

- Add a Parameter Connector to the **OI[0]** Pin
- Enter Parameter Connector Information
  - **CM#\_FV103.DEVCTLA.PVFL[1]\***
- **Close** and **Save** changes

6 - 4

## Notes

### Modifying Existing CMs

Changes may be made to a CM in the project view without deactivating the CM. Eventually the CM will have to be deactivated for the changes to be loaded. Then the CM may be reactivated.

The device control function block has three kinds of interlocks : **Process Overrides**, **Process Permissives**, and the **Safety Override**. All three deal with the state ordinal values of the device control block : States 0 and 1 for a 2-State; and States 0, 1, and 2 for a 3-State device. Process interlocks can be bypassed; the Safety interlock cannot.

In the above example, we added an input pin for the process override interlock OI[0]. When this Boolean parameter goes true, the device is forced to the 0 State.

\* The parameter connection we used is a Boolean parameter. It is a flag that is true when CM#\_FV103 is in the 1 State. This interlock therefore closes the Tank A valve when the Reactor drain valve is open. In the Point Selector tool, only the PVFL[0] parameter appears in the list. Choose it and then edit the connection to [1]

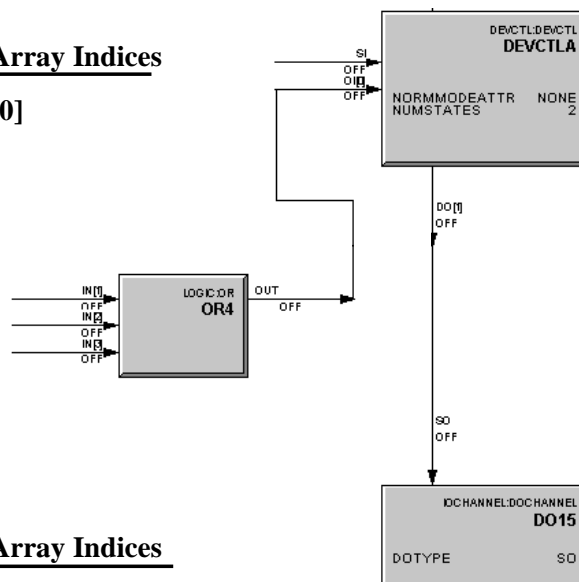

**Honeywell**

## Modify Existing CMs to Interlock (CM#\_FV102)

- Open CM#\_FV102
- Add the following pin to DEVCTLA

| Pin | Location   | Array Indices |
|-----|------------|---------------|
| OI  | Input/Left | [0]           |

- Add an **OR** Block
- Add the following Wire
  - **OR - OUT** to **DEVCTLA - OI[0]**

- Add the following pin to the **OR** block

| Pin | Location   | Array Indices |
|-----|------------|---------------|
| IN  | Input/Left | [3]           |

6 - 5

## Notes

### Interlocking CM#\_FV102

To interlock the Tank B bottom valve to the 0 State (closed), we will monitor three different process parameters.

The OR block will allow any one of the three to force the valve to the closed state.

For more information on using the OR block, refer to *Control Builder Components Theory, Logic Functions, Logic Function Blocks, OR Block*.

## Honeywell

### Modify Existing CMs to Interlock (CM#\_FV102)

...continued

- Add a Parameter Connector to the **IN[1]** Pin
- Enter Parameter Connector Information
  - **CM#\_FV103.DEVCTLA.PVFL[1]**
- Add a Parameter Connector to the **IN[2]** Pin
- Enter Parameter Connector Information
  - **CM#\_LVLA.LEVEL\_REACTR.PVHIALM.FL**
- Add a Parameter Connector to the **IN[3]** Pin
- Enter Parameter Connector Information
  - **CM#\_ACCA.TOTAL\_B.ACCTVFL**
- **Close** and **Save** changes

6 - 6

## Notes

### Interlocking CM#\_FV102

The three parameters, any one of which will force the Tank B bottom valve closed are:

- The Reactor drain valve (CM#\_FV103) being in the Open (1) state
- The Reactor being full as designated by the PVHI alarm on the Reactor level indicator
- The total amount of ingredient B designated to be charged to the Reactor being reached

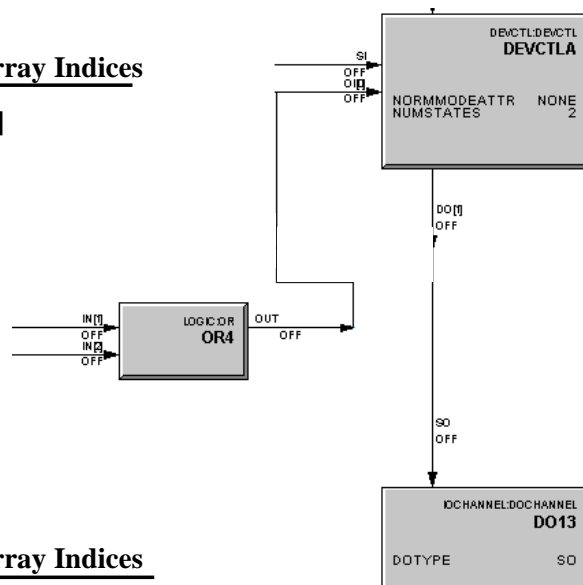

## Honeywell

### Modify Existing CMs to Interlock (CM#\_FV103)

- Open CM#\_FV103
- Add the following pin to DEVCTLA

| Pin | Location   | Array Indices |
|-----|------------|---------------|
| OI  | Input/Left | [0]           |

- Add an **OR** Block
- Add the following Wire
  - **OR - OUT** to **DEVCTLA - OI[0]**

- Add the following pin to the **OR** block

| Pin | Location   | Array Indices |
|-----|------------|---------------|
| IN  | Input/Left | [3]           |

6 - 7

## Notes

### Interlocking FV103

As with CM#\_FV102, we will interlock the Reactor drain valve with 3 different parameters, using an OR Logic function block.

---

---

---

---

---

---

---

## Honeywell

### Modify Existing CMs to Interlock (CM#\_FV103)

...continued

- Add a Parameter Connector to the **IN[1]** Pin
- Enter Parameter Connector Information
  - **CM#\_ACCA.TOTAL\_REACTR.ACCTVFL**
- Add a Parameter Connector to the **IN[2]** Pin
- Enter Parameter Connector Information
  - **CM#\_FV101.DEVCTLA.PVFL[1]**
- Add a Parameter Connector to the **IN[3]** Pin
- Enter Parameter Connector Information
  - **CM#\_FV102.DEVCTLA.PVFL[1]**
- **Close** and **Save** changes

6 - 8

## Notes

### Interlocking CM#\_FV103

The three parameters, any one of which will force the Reactor drain valve closed are:

- The total amount of product designated to be drained from the Reactor being reached
- The Tank A bottom valve (FV101) being in the Open (1) state
- The Tank B bottom valve (FV102) being in the Open (1) state

## Create a New CM (CM#\_LK01)

- Create a new CM
- Modify the settings to match the information below
  - **Main** tab
    - Name **CM#\_LK01**
    - Description **INTERLOCK CM**
- Close **CM#\_LK01** and save changes
- Assign **CM#\_LK01** to **CEE0101**

6 - 9

## Notes

### Logic CM CM#\_LK01

To interlock the Pumps, we will demonstrate a second method of interlocking: creating a Logic CM and using parameter connections from it to the devices we wish to interlock.

In this CM we will create the interlock strategy for all three pumps, CM#\_PMP101, CM#\_PMP102, and CM#\_PMP103.

---

---

---

---

**Honeywell**

## Configure CM (CM#\_ LK01)

- Open CM#\_LK01
- Add a LE Block
- Modify the settings to match the information below
  - Name **CHK\_FV101RC**
- Add a Parameter Connector to the IN[1] Pin
- Enter Parameter Connector Information

– **CM#\_FV101RC.PIDA.OP**

- Add a **Numeric** Block connected to IN[2]
- Modify the settings to match the information below
  - Name **LOW\_FLOW**
    - PV High Limit 10.0
    - PV Low Limit 0.0
    - Actual Value 2.0
    - PV Display Format D1

6 - 10

## Notes

### Logic CM CM#\_LK01

First we will create the interlocks for CM#\_PMP101, the pump in the A transfer line. This pump will be interlocked to the Off (0) state when any one of the three following conditions is true:

- The tank A bottom valve is closed
- The Reactor is full as designated by the Reactor level indicator being in PVHI alarm
- The A transfer line regulatory control valve, CM#\_FV101RC, is closed as designated by its OP being less than or equal to 2 percent open.

To check the third condition we will use a Logic LE Function block. The result of that block is then input to an OR block along with parameter connections for conditions 1 and 2.

For more information on using the OR block, refer to *Control Builder Components Theory, Logic Functions, Logic Function Blocks, LE Block*.

**Honeywell**

## Configure CM (CM#\_ LK01) ...continued

- Add an **OR** Block
  - Modify the settings to match the information below
    - Name **CM#\_PMP101**
  - Add Pin **IN[3]**

- Add a Parameter Connector to the **IN[1]** Pin

- Enter Parameter Connector Information

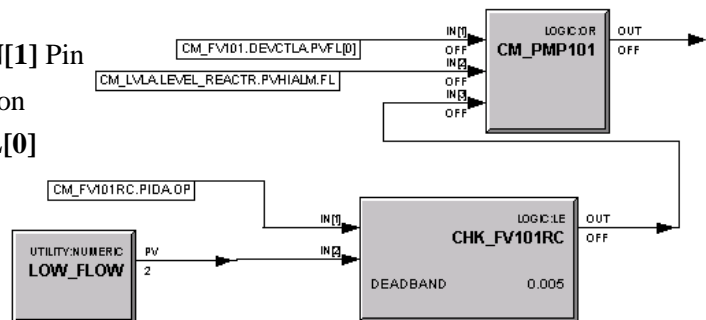

– **CM#\_FV101.DEVCTLA.PVFL[0]**

- Add a Parameter Connector to the **IN[2]** Pin

- Enter Parameter Connector Information

– **CM#\_LVLA.LEVEL\_REACTR.PVHIALM.FL**

- Soft wire the **LE** block **OUT** to the **IN[3]** Pin

6 - 11

## Notes

### CM#\_PMP101 Interlock

Here we complete the interlock for CM#\_PMP101, the pump in the A transfer line. The .OUT parameter from the OR Block will become the parameter connector to CM#\_PMP101.DEVCTLA.OI[0].

## Honeywell

### Configure CM (CM#\_ LK01) ...continued

- Add a second **OR** Block for **CM#\_PMP102**
- Modify the settings to match the information below
  - **Main** tab
    - Name **CM#\_PMP102**
- Add a Parameter Connector to the **IN[1]** Pin
- Enter Parameter Connector Information
  - **CM#\_FV102.DEVCTLA.PVFL[0]**
- Add a Parameter Connector to the **IN[2]** Pin
- Enter Parameter Connector Information
  - **CM#\_LVLA.LEVEL\_REACTR.PVHIALM.FL**

6 - 12

## Notes

### CM#\_PMP102 Interlock

Next we will interlock CM#\_PMP102, the pump in the B transfer line. This pump will be interlocked to the Off (0) state when either of the following two conditions is true:

- The tank B bottom valve is closed.
- The Reactor is full as designated by the Reactor level indicator being in PVHI alarm.

This will be accomplished with two parameter connections to an OR block. The .OUT parameter from the OR Block will then become the parameter connector to CM#\_PMP102.DEVCTLA.OI[0].

## Honeywell

### Configure CM (CM#\_LK01) ...continued

- Add a third **OR** Block for **CM#\_PMP103**
- Modify the settings to match the information below
  - **Main** tab
    - Name **CM#\_PMP103**
- Add a Parameter Connector to the **IN[1]** Pin
- Enter Parameter Connector Information
  - **CM#\_FV103.DEVCTLA.PVFL[0]**
- Add a Parameter Connector to the **IN[2]** Pin
- Enter Parameter Connector Information
  - **CM#\_LVLA.LEVEL\_REACTR.PVLLALM.FL**
- Close and Save changes

6 - 13

## Notes

### CM#\_PMP103 Interlock

Last we will interlock CM#\_PMP103, the pump in the Reactor drain line. This pump will be interlocked to the Off (0) state when either of the following two conditions is true:

- The Reactor drain valve is closed.
- The Reactor is empty as designated by the Reactor level indicator being in PVLL alarm.

This will be accomplished with two parameter connections to an OR block. The .OUT parameter from the OR Block will then become the parameter connector to CM#\_PMP103.DEVCTLA.OI[0].

**Honeywell**

## Modify Existing CMs to Interlock (CM#\_PMP101)

- Open CM#\_PMP101
- Add the following pin to DEVCTLA
 

| Pin | Location   | Array Indices |
|-----|------------|---------------|
| OI  | Input/Left | [0]           |
- Add a Parameter Connector to the OI[0] Pin
- Enter Parameter Connector Information
  - CM#\_LK01.CM#\_PMP101.OUT
- Close and Save changes

6 - 14

## Notes

### Interlock CM#\_PMP101

CM#\_LK01 contains the logic required to force the pump to the stop condition. If we want to now use that logic, we can use a single parameter connection from the appropriate logic output in CM#\_LK01 to the operational override on the pump.

The same applies to CM#\_PMP102 and CM#\_PMP103.

**Note:** After configuring the parameter connection for CM#\_PMP101, you can select the connection, highlight the text, and go to Edit > Copy. This puts the text in a buffer which can then be pasted into the parameter connections for CM#\_PMP102 and CM#\_PMP103 for modification.

## Modify Existing CMs to Interlock (CM#\_ PMP102)

- | Pin | Location   | Array Indices |
|-----|------------|---------------|
| OI  | Input/Left | [0]           |

- Enter Parameter Connector Information
  - **CM# LK01.CM# PMP102.OUT**

- Close and Save changes

6 - 15

## Notes

## Modify Existing CMs to Interlock (CM#\_ PMP103)

- | Pin | Location   | Array Indices |
|-----|------------|---------------|
| OI  | Input/Left | [0]           |

- Enter Parameter Connector Information
  - **CM# LK01.CM# PMP103.OUT**

- 6 - 16

**Honeywell**

# **PlantScape Controller Implementation**

## **Lesson 2**

# **Configuring Safety Override Interlocks**

---

6 - 19

---

### **Notes**

#### **Introduction**

The purpose of this Lesson is to give you the knowledge to be able to configure Safety Overrides and Interlocks. After you complete this Lesson you will have Interlocked the Valves and Agitator in this project to close when certain alarms are activated.

#### **Objectives**

- ❶ Modify existing CMs for Interlock
- ❷ Set the Safe States in DEVCTL blocks
- ❸ Inactivate, Re-Load and Reactivate all CMs modified in Unit 6
- ❹ Use the Safe output to interlock in a PID loop

### Modify Existing CMs

- Open **CM#\_FV101**
- Add a Parameter Connector to the **SI** Pin on **DEVCTLA**
- Enter Parameter Connector Information
  - **CM#\_LVLA.LEVEL\_REACTR.PVHHALM.FL**
- Double click the **DEVCTL** block
  - Click on the **Output** tab
  - Verify that the Safe State is **S0** (Closed)
- **Close** and **Save** changes
- Repeat for **CM#\_FV102**

6 - 20

### Notes

#### Safety Interlocks -- Device Control

Here we are interlocking CM#\_FV101 and CM#\_FV102, the two tank bottom valves. We are using the safety interlock to force them closed (0) when the Reactor is very full as designated by the Level Indicator being in PVHH alarm.

Recall that we have process overrides on these same valves to force them shut when the Reactor is in PVHI alarm. Those can be bypassed. The safety interlocks have higher priority and cannot be bypassed.

We will add parameter connections to the SI input pins of the valve DEVCTL blocks to configure the interlocks.

Changes may be made to a CM in the project view without deactivating the CM. Eventually the CM will have to be deactivated for the changes to be loaded. Then the CM may be reactivated .

**Honeywell**

### Modify Existing CMs to Interlock (CM#\_AGIT101)

- Open CM#\_AGIT101
- Add a Parameter Connector to the **SI** Pin
- Enter Parameter Connector Information
  - **CM#\_LVLA.LEVEL\_REACTR.PVLLALM.FL**
- Double click the **DEVCTL** block
  - Set the Safe State to S2 (Stopped)
- **Close** and **Save** changes

6 - 21

### **Notes**

#### **Safety Interlocks -- Device Control**

Here we are interlocking CM#\_AGIT101, the reactor agitator. We are using the safety interlock to force it to the Stopped state (2) when the Reactor is empty as designated by the Level Indicator being in PVLL alarm.

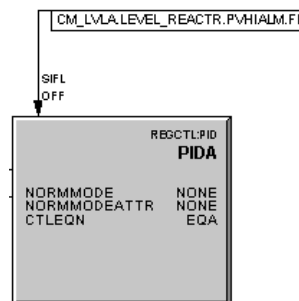

We will add a parameter connection to the SI input pin of the agitator DEVCTL block to configure the interlock.

# Honeywell

### Modify Existing CMs to Interlock (CM#\_FV101RC)

- Open CM#\_FV101RC
- Add the following pin to **PIDA**

| Pin  | Location  |
|------|-----------|
| SIFL | Input/Top |
- Add a Parameter Connector to the **SIFL** Pin
- Enter Parameter Connector Information
  - CM#\_LVLA.LEVEL\_REACTR.PVHHALM.FL
- Double click in the **PIDA** block
  - Change SI option to SHEDSAFE
- Click on **Output** tab
  - Set safe OP to 0
- **Close** and **Save** changes

Safety Interlock Option:

Bad Control Option:

Safe OP (%):

6 - 22

## Notes

### Safety Interlocks -- Regulatory Control

Regulatory Control CMs also have Safety Interlock capability.

The parameters used to affect the interlock are SIFL ( Safety Interlock Flag) and SIOPT (Safety Interlock Option). When SIFL goes true, the CM behaves according to the configured SIOPT. (See the reference below for more information.)

In our process, we are using the SIOPT of SHEDSAFE when the Reactor Level is in PVHH alarm. SHEDSAFE causes a regulatory control CM (FV101RC) to :

- Change Mode to MAN
- Change Modattr to OPER
- Disable External Mode Switching
- Change OP to the configured Safe OP (0.0 for FV101RC)

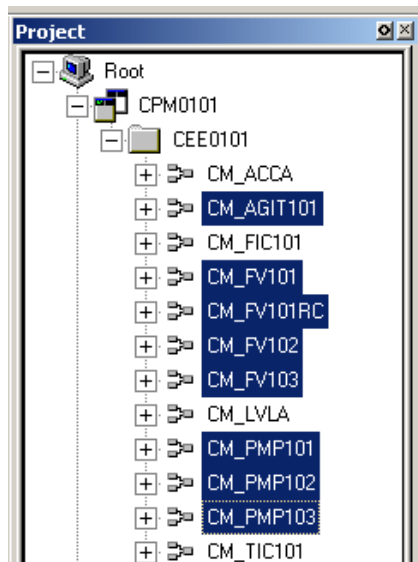

### Deactivating , Reloading, and Reactivating CMs

- Select the CMs you created and modified in Unit 6 in the Project tab

- CM#\_FV101
- CM#\_FV101RC
- CM#\_FV102
- CM#\_FV103
- CM#\_LK01
- CM#\_PMP101
- CM#\_PMP102
- CM#\_PMP103
- CM#-AGIT101

- Click the down-arrow

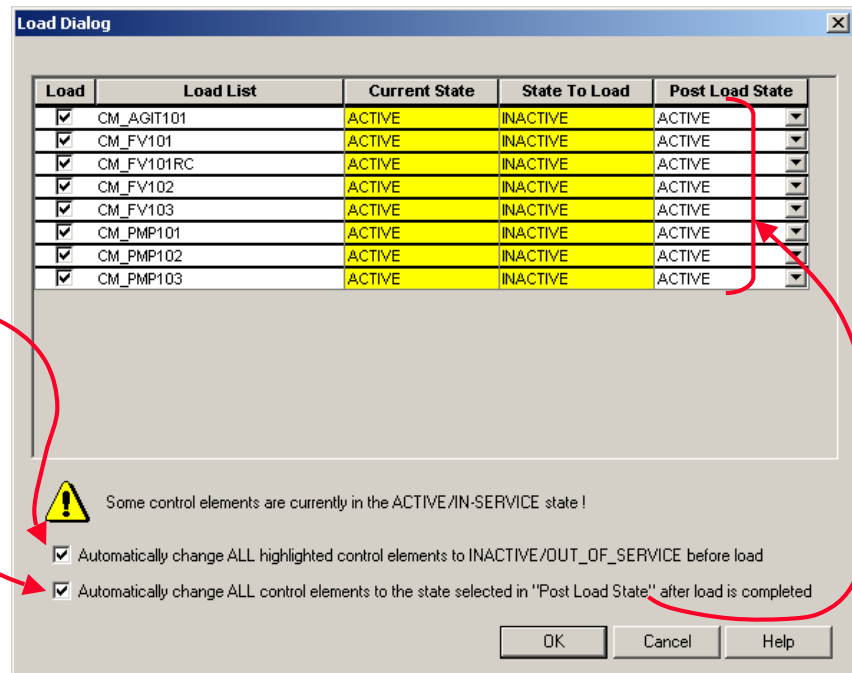

6 - 23

### Notes

### Deactivating , Reloading, and Reactivating CMs (R400)

- The selected CMs appear in the **Load Dialog** box along with their Current States
- Click the check box to automatically inactivate the CMs before loading
- Click the check box to automatically reactivate the CMs after loading
- Click OK

6 - 24

### Notes

#### Deactivating and Reloading CMs

CMs must be inactivated to load changes. Prior to R400, IOMs and CMs had to be manually inactivated from the Monitor tab. After loading, they had to be reactivated from the Monitor tab. This functionality is still available, and the following pages are included for reference to demonstrate a convenient way to do this manual deactivate/reactivate operation for an entire controller.

R400 allows the load function itself to inactivate and reactivate the modified objects. If you do not inactivate manually prior to loading, the check box to **Automatically change to INACTIVE** must be checked.

The check box to return to the selected **Post Load State** is optional. If it is not checked, the CMs will remain inactive after load. Note that any load errors also will leave the loaded objects in the INACTIVE state.

### Reference: Manually Deactivating CMs

- Deactivate your CMs by right-clicking the CEE and selecting
  - Inactivate
    - This CEE's IOMs and CMs

6 - 25

### Notes

#### Manually Deactivating and Reactivating CMs

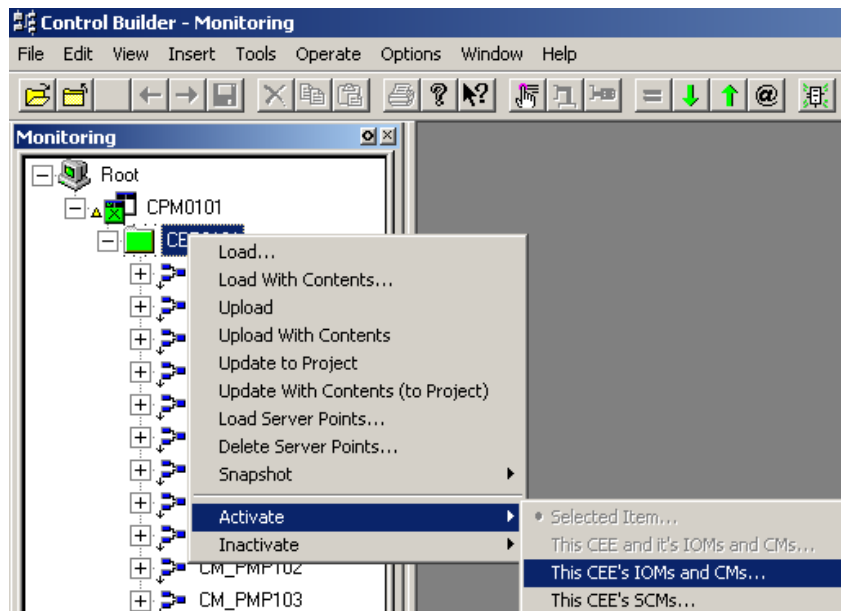

CMs must be inactivated to load changes. Prior to R400, IOMs and CMs had to be inactivated from the Monitor tab. After loading, they had to be re-activated from the Monitor tab.

As shown here and on the next page, the manual inactivate and reactivate functions are still available

### Reference: Manually Reactivating CMs

- Activate your CMs by right-clicking the CEE and selecting
  - **Activate**
    - This CEEs IOMs and CMs

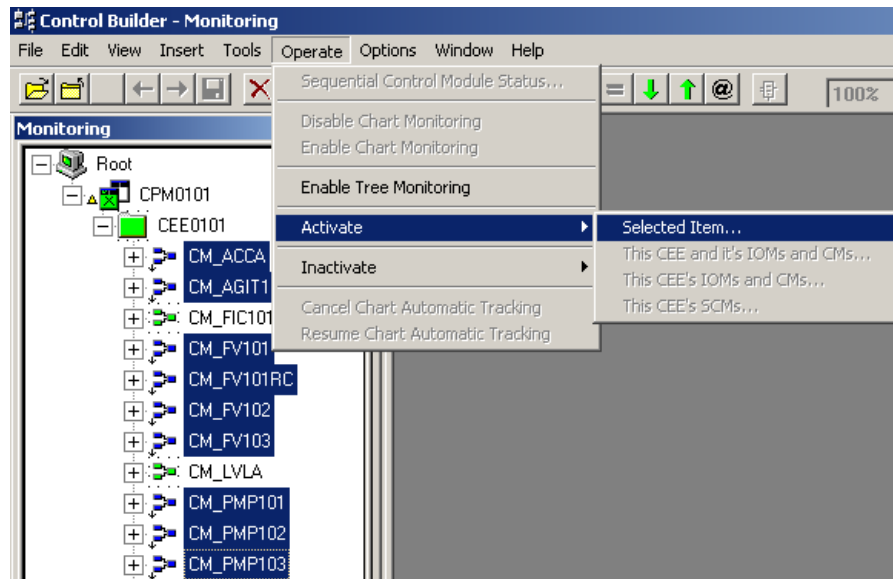

6 - 26

### Notes

# **PlantScape Controller Implementation**

## **Lesson 3**

### **Manual Operation**

6 - 29

#### **Notes**

#### **Introduction**

Now that you have configured all the required CMs it is time to verify their operation. In this lesson you will verify your project configuration by manually creating a product. To facilitate the process, three custom displays have been built for you to operate the CMs. This will enable you to remain within Station and perform all the steps required to create a product. The following lab uses two displays named **C#\_OP1** and **C#\_OP2**. A third display not shown in the lab depicts the entire process and can also be used. It is called **C#\_process**. An additional way to operate is to use the groups you created in the configuration labs.

#### **Objectives**

- ❶ Combine two substances to create a product
- ❷ Verify correct configuration of your project

Operating CMs Manually

**Step 1. Preparing the CMs**

- 1. Ensure all the project CMs are in **Operator** Mode Attribute (View from Groups)
- 2. Ensure Ingredients A and B totalizers are in **Operator** Command Attribute

## Step 2. Preparing Tank Levels and Targets

1. **Reset** and **Start** the totalizers for Tanks A and B
2. Enter target amounts for Ingredients A and B: **100** for A; **75** for B.

The screenshot displays the 'CM Manual Operation' interface for 'Tank A & B' under the 'Reaction / Drain' tab. The interface is divided into three main sections: Tank A, Tank B, and a shared Reactor section.

**Tank A Section:**

- Total Used:** 0.00 (green)
- Level:** 150.00 (red)
- Flow:** 35.00 (yellow)
- COMMAND:** NONE (dropdown)
- MD Attr:** OPERATOR (dropdown)
- FV101:** CLOSED (green) / CLOSED (dropdown)
- PMP101:** STOP (green) / STOP (dropdown)

**Tank B Section:**

- Total Used:** 0.00 (green)
- Level:** 150.00 (red)
- Flow:** 0 (purple)
- COMMAND:** NONE (dropdown)
- MD Attr:** OPERATOR (dropdown)
- FV102:** CLOSED (green) / CLOSED (dropdown)
- PMP102:** STOP (green) / STOP (dropdown)

**Reactor Section:**

- Total Used:** 0.00 (green)
- Level:** 0.00 (red)

**Accumulator Target Values:**

- Tank A:** 100.00 (yellow)
- Tank B:** 75.00 (yellow)
- Reactor:** 0.00 (yellow)

6 - 32

## Notes

## Step 2. Preparing Tank Levels and Targets

### 1. Reset and Start the Totalizer for the reactor

The screenshot displays the 'CM Manual Operation' interface for the 'Reaction / Drain' process. The 'Reactor' section shows a tank icon and a flow meter. The 'Temperature' section shows two temperature controllers, TIC101 and FIC101. The 'Agitation' section shows three buttons: HIGH, LOW, and STOPPED. The 'Accumulator Target Values' section shows target values for Tank A, Tank B, and the Reactor.

| Tank A     |        |
|------------|--------|
| Total Used | 0.00   |
| Level      | 150.00 |

| Tank B     |        |
|------------|--------|
| Total Used | 0.00   |
| Level      | 150.00 |

| Reactor    |      |
|------------|------|
| Total Used | 0.00 |
| Level      | 0.00 |

| Accumulator Target Values |        |
|---------------------------|--------|
| Tank A                    | 100.00 |
| Tank B                    | 75.00  |
| Reactor                   | 0.00   |

| Temperature |       |
|-------------|-------|
| SP          | 35.00 |
| PV          | 35.00 |
| OP          | 35.44 |
| MD          | AUTO  |

| Temperature |       |
|-------------|-------|
| SP          | 1772  |
| PV          | 1772  |
| OP          | 35.00 |
| MD          | CAS   |

| Temperature Setpoint |       |
|----------------------|-------|
| Setpoint             | 35.00 |

| Agitation |       |
|-----------|-------|
| HIGH      |       |
| LOW       |       |
| STOPPED   | PV OP |
| STOPPED   |       |

| Reactor |          |
|---------|----------|
| COMMAND | NONE     |
| MD Attr | OPERATOR |
| FV103   | CLOSED   |
| PMP103  | STOP     |

6 - 33

Notes

Honeywell

### Step 3. Charge Ingredient A

1. Open **CM#\_FV101** and Start **CM#\_PMP101**. (Recall that the pump is interlocked closed until the valve is open.)

The screenshot displays the 'CM Manual Operation' interface. On the left, there are summary panels for Tank A, Tank B, and the Reactor, showing 'Total Used' and 'Level' values. The main area is divided into two columns for Tank A and Tank B. Each column contains a tank diagram, a flow meter, and control buttons for COMMAND, MD Attr, FV (Valve), and PMP (Pump). A red arrow points to the 'FV101' dropdown menu, which is currently set to 'CLOSED'. Another red arrow points to the 'PMP101' dropdown menu, which is currently set to 'STOP'.

| Component | Total Used | Level  |
|-----------|------------|--------|
| Tank A    | 0.00       | 150.00 |
| Tank B    | 0.00       | 150.00 |
| Reactor   | 0.00       | 0.00   |

| Parameter | Value  |
|-----------|--------|
| Tank A    | 100.00 |
| Tank B    | 75.00  |
| Reactor   | 0.00   |

| Control        | Value    |
|----------------|----------|
| Tank A COMMAND | NONE     |
| Tank A MD Attr | OPERATOR |
| Tank A FV101   | CLOSED   |
| Tank A PMP101  | STOP     |
| Tank B COMMAND | NONE     |
| Tank B MD Attr | OPERATOR |
| Tank B FV102   | CLOSED   |
| Tank B PMP102  | STOP     |

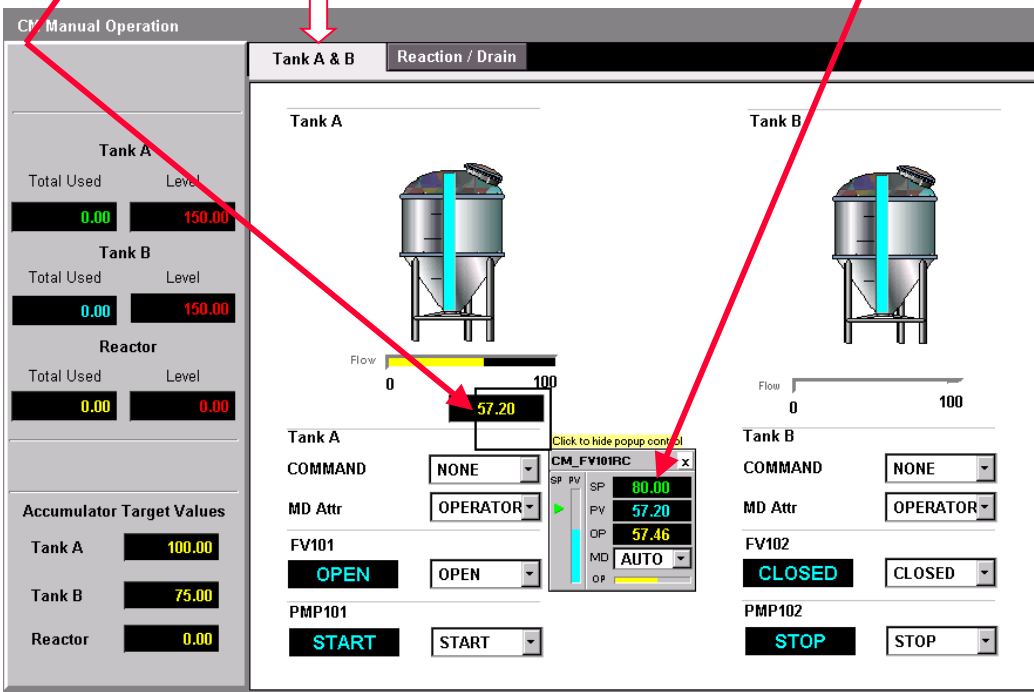

6 - 34

### Notes

Step 3. Charge Ingredient A

1. Set the Ingredient A flow rate to 80 by clicking on the PV and entering data into the pop-up. ( The flow rate is set on **CM#\_FV101RC.PIDA.SP.**)

6 - 35

Notes

### Step 3. Charge Ingredient A

When the total used of Ingredient A approaches the target of 100:

1. Close **CM#\_FV101RC** (Mode to **Man**, **OP** to 0.)
2. Close **CM#\_FV101**. (Interlocks will then stop the Pump.)
3. Click on the pop-up to clear it from the display.

The screenshot displays the 'CM Manual Operation' window for 'Tank A & B' under the 'Reaction / Drain' tab. On the left, a summary panel shows 'Total Used' and 'Level' for Tank A (98.00, 52.00), Tank B (0.00, 150.00), and the Reactor (0.00, 98.00). Below this are 'Accumulator Target Values' for Tank A (100.00), Tank B (75.00), and the Reactor (0.00). The main area shows two tank diagrams with flow meters. Tank A's flow is 0.00, and Tank B's flow is 0.00. Below the tanks are control buttons for 'FV101' (OPEN, OPEN), 'PMP101' (START, START), 'FV102' (CLOSED, CLOSED), and 'PMP102' (STOP, STOP). A pop-up window for 'CM\_FV101RC' is visible, showing 'SP' (80.00), 'PV' (0.00), 'OP' (0.00), and 'MD' (MAN). Red arrows from the instructions point to the 'Total Used' for Tank A, the 'CM\_FV101RC' pop-up, and the 'OPEN' button for 'FV101'.

6 - 36

**Notes**

Honeywell

Step 4. Begin mixing

1. Start the agitator on low speed.

The screenshot displays the 'CM Manual Operation' interface with the 'Reaction / Drain' tab selected. On the left, a sidebar shows 'Tank A' (Total Used: 98.00, Level: 52.00), 'Tank B' (Total Used: 0.00, Level: 150.00), and 'Reactor' (Total Used: 0.00, Level: 98.00). Below this is the 'Accumulator Target Values' section. The main area features a 'Reactor' diagram with a 'Flow' scale from 0 to 100. Below the diagram are controls for 'COMMAND' (NONE), 'MD Attr' (OPERATOR), 'FV103' (CLOSED), 'PMP103' (STOP), and 'Agitation'. The 'Agitation' section has buttons for 'HIGH', 'LOW', and 'STOPPED'. The 'LOW' button is circled in red, and a red arrow points to it from the instruction '1. Start the agitator on low speed.'. To the right of the 'Agitation' buttons is a 'Temperature' section with two vertical scales: 'DEG C' (0.0 to 100.0) and 'LB/HR' (0.0 to 5000.0). Below these are 'TIC101' and 'FIC101' displays. The 'Temperature Setpoint' is set to 35.00. The 'Agitation' section also includes a 'LOW' dropdown menu.

| Tank A     |       |
|------------|-------|
| Total Used | 98.00 |
| Level      | 52.00 |

| Tank B     |        |
|------------|--------|
| Total Used | 0.00   |
| Level      | 150.00 |

| Reactor    |       |
|------------|-------|
| Total Used | 0.00  |
| Level      | 98.00 |

| Accumulator Target Values |        |
|---------------------------|--------|
| Tank A                    | 100.00 |
| Tank B                    | 75.00  |
| Reactor                   | 0.00   |

| Reactor Controls |          |
|------------------|----------|
| COMMAND          | NONE     |
| MD Attr          | OPERATOR |
| FV103            | CLOSED   |
| PMP103           | STOP     |

| Agitation |       |
|-----------|-------|
| HIGH      |       |
| LOW       | PV OP |
| STOPPED   |       |

| Temperature |        |
|-------------|--------|
| DEG C       | LB/HR  |
| 0.0         | 0.0    |
| 100.0       | 5000.0 |
| SP          | SP     |
| 35.00       | 1772   |
| PV          | PV     |
| 34.98       | 1773   |
| OP          | OP     |
| 35.44       | 34.98  |
| MD          | MD     |
| AUTO        | CAS    |

Temperature Setpoint: 35.00

Agitation: LOW

6 - 37

Notes

### Step 5. Charge Ingredient B

1. Open CM#\_FV102 and Start CM#\_PMP102. ( Remember the pump is interlocked closed until the valve is open.)

The screenshot displays the 'CM Manual Operation' interface. On the left, a sidebar shows 'Accumulator Target Values' for Tank A (100.00), Tank B (75.00), and Reactor (0.00). The main area is divided into 'Tank A' and 'Tank B' sections. Each section includes a tank diagram, a flow meter (0 to 100), and a status table. The 'Reaction / Drain' tab is selected. In the 'Tank B' status table, the 'FV102' valve is shown as 'CLOSED' with a dropdown menu. A red circle highlights this dropdown, and a red arrow points to it from the instruction text above. Another red arrow points to the 'Reaction / Drain' tab.

| Tank A     |       |
|------------|-------|
| Total Used | 98.00 |
| Level      | 52.00 |

| Tank B     |        |
|------------|--------|
| Total Used | 0.00   |
| Level      | 150.00 |

| Reactor    |       |
|------------|-------|
| Total Used | 0.00  |
| Level      | 98.00 |

| Tank A  |          |
|---------|----------|
| COMMAND | NONE     |
| MD Attr | OPERATOR |
| FV101   | CLOSED   |
| PMP101  | STOP     |

| Tank B  |          |
|---------|----------|
| COMMAND | NONE     |
| MD Attr | OPERATOR |
| FV102   | CLOSED   |
| PMP102  | STOP     |

6 - 38

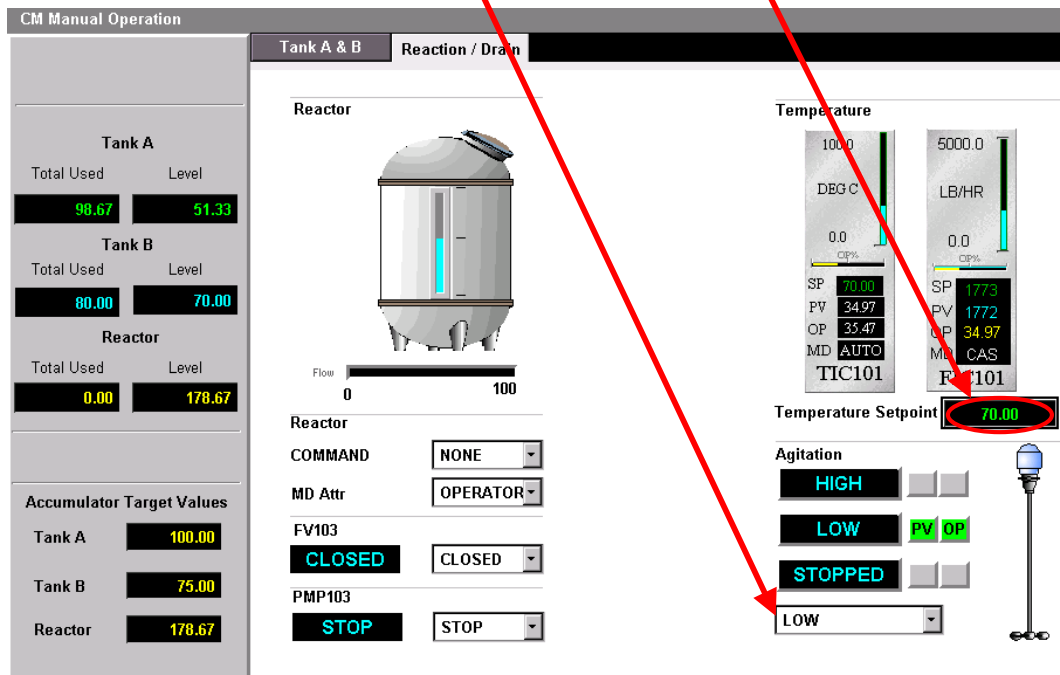

Notes

**Honeywell**

**Step 6. Start the reaction**

1. **Wait** for Ingredient B to shut off automatically due to interlocks.
2. Enter the reactor temperature target of 70 Degrees by changing the **SP** of **CM#\_TIC101** to 70.
3. Change the agitator from low to high speed.

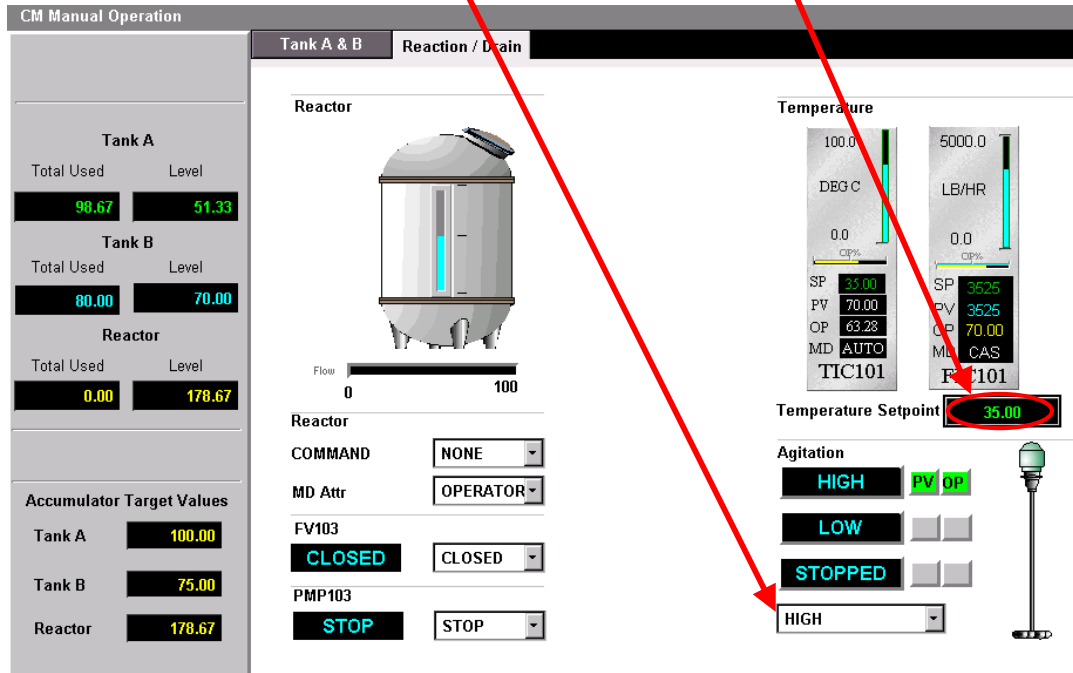

6 - 39

**Notes**

**Honeywell**

**Step 7. Complete the reaction**

1. **Wait** for the temperature to reach 70 Degrees.
2. Enter a reactor temperature target of 35 Degrees by changing the **SP** of **CM#\_TIC101** to 35.
3. Change the agitator from high to low speed.

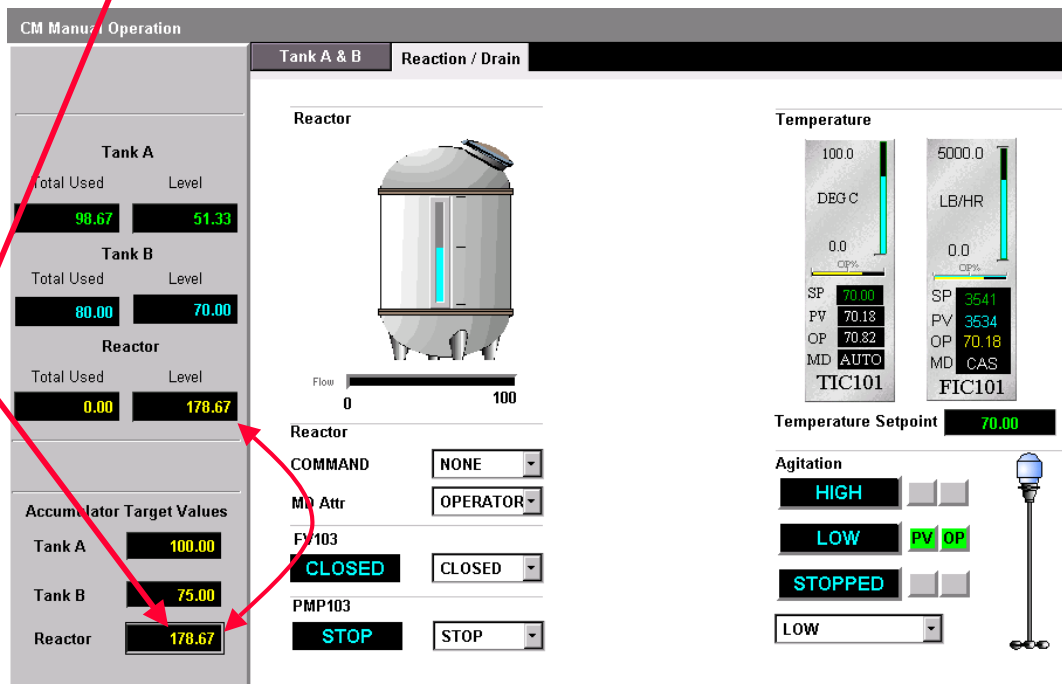

6 - 40

**Notes**

### Step 8. Drain the reactor

1. Enter the reactor drain target amount. It will be equal to the reactor level.

6 - 41

### Notes

**Step8. Drain the reactor**

1. Open **CM#\_FV103** and Start **CM#\_PMP103**. ( Remember that the pump is interlocked closed until the valve is open.)
2. Wait for the interlocks to stop the agitator, Close **CM#\_FV103**, Stop **CM#\_PMP103**

CM Manual Operation

Tank A & B    Reaction / Drain

**Tank A**  
Total Used    Level  
98.67    51.3

**Tank B**  
Total Used    Level  
80.00    70.00

**Reactor**  
Total Used    Level  
0.00    178.67

Accumulator Target Values  
Tank A    100.00  
Tank B    75.00  
Reactor    178.67

**Reactor**

Reactor Level: 0 to 100

Reactor COMMAND: NONE  
MD Attr: OPERATOR

# **PlantScape Controller Implementation**

## **Lesson 4**

### **Configuring Message Blocks**

---

6 - 45

---

#### **Notes**

##### **Introduction**

The purpose of this Lesson is to give you the knowledge to be able to configure Message Blocks. Message Blocks give the Hybrid Controller the ability to send messages to Stations. The blocks are capable of sending messages on command from SCMs, as well as for process related reasons from CMs. In this module we will create a new CM to send messages. We will configure the Message Blocks to send messages when Safety Interlocks are triggered. Later we will use this same CM to send messages from SCM commands.

##### **Objectives**

- ❶ Create a new CM named CM#\_MESSAGES.
- ❷ Add and configure the Message Blocks needed to send messages for the project.
- ❸ Configure Safety Interlock occurrences to send messages to Station.

## Creating and Configuring a New CM

- Click
  - **File**
    - **New**
      - **Control Module**
- Double Click on the newly created CM in the control drawing area of Control Builder
- Enter the following information into the Main page
  - Name **CM#\_MESSAGES**
  - Description **Messages for Project**
  - Execution Period **1000MS**
- Click **OK**
- Close **CM#\_MESSAGES** and save changes
- Assign **CM#\_MESSAGES** to **CEE0101**

6 - 46

## Notes

### Creating a Message CM

Message Blocks can be added to any CM. We could have added Message Blocks to existing CMs in the project and achieved the same functionality.

In this module, we are concentrating on Message Block configuration so we created a separate CM which will be used for all messages in the project.

**Honeywell**

## Adding and Configuring Message Blocks

- Open CM#\_MESSAGES
- Click on the **Library** tab and add three of the following Function Blocks
- | <u>Library Directory</u> | <u>Block Type</u> |
|--------------------------|-------------------|
| – UTILITY                | MESSAGE           |

- Name the three blocks: **XFERA**, **XFERB**, and **REACTOR**. We will add messages to each block that relate to these three parts of the project.
- First we will add Messages to **XFERA**
- Double click on block XFERA to bring up the configuration form shown on the next page.

6 - 47

## Notes

### Message Blocks

Message Blocks are found in the Utility family of Function Blocks. Each has the ability to store up to 16 messages of up to 60 characters each.

Each message has an index number, ranging from 0 to 15.

**Honeywell**

## Adding and Configuring Message Blocks ...continued

**Message Type (INFO or CONFIRM)**

**Message Index Numbers**

| Message Type | Message Text |
|--------------|--------------|
| 0 INFO       |              |
| 1 INFO       |              |
| 2 INFO       |              |
| 3 INFO       |              |
| 4 INFO       |              |
| 5 INFO       |              |
| 6 INFO       |              |
| 7 INFO       |              |
| 8 INFO       |              |
| 9 INFO       |              |
| 10 INFO      |              |
| 11 INFO      |              |
| 12 INFO      |              |
| 13 INFO      |              |
| 14 INFO      |              |
| 15 INFO      |              |

**Message Text (60 Characters Maximum, each)**

- We will add two messages using indexes 0 and 1.

6 - 48

## Notes

### Configuring Messages

The Main Page of the Message Block configuration form contains all 16 messages of the block.

To add a message, simply type the message into the appropriate index Message text port.

The Message Type indicates how the message will be used in the control scheme, and how it will appear and be acknowledged in the Station Message Summary page. INFO type messages are for information only. They are removed from the Message Summary upon Acknowledgement.

CONFIRM messages are usually used in SCMs to halt the program until confirmation. We will learn about CONFIRM messages in the SCM portion of the course.

## Adding and Configuring Message Blocks ...continued

- Enter the following message in Index 0 Message Text:  
**CM#\_FV101 SAFETY INTERLOCK --- FULL REACTOR**
- Enter the following message in Index 1 Message Text  
**CM#\_FV101RC SAFETY INTERLOCK --- FULL REACTOR**
- Accept the Default Message Type: INFO

Next we will configure the method to send the messages to Stations

- Add an input pin for the Send Flag for the Index 1 message. Note that the Flag for Index 0 is the only default input pin.

6 - 49

## Notes

### Configuring Message Send Flags

When a client triggers a given Send Flag (SENDFLAG[n]) input, the corresponding message (MESSAGE[n]) is sent to the Server's Message Summary. Messages are then viewed by the Stations in the Message Summary and the Event Summary, filtered by any Area restrictions that might apply.

Here we are using the Send Flags for Messages 0 and 1 as input pins. We can then configure Boolean type parameter connections to the inputs to trigger the messages.

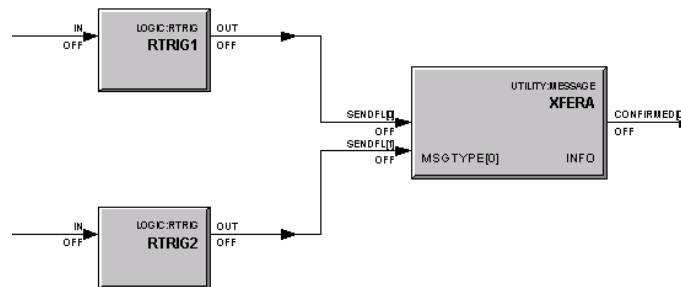

## Adding and Configuring Message Blocks ...continued

- Click on the **Library** tab and add two of the following Function Blocks

| <u>Library Directory</u> | <u>Block Type</u> |
|--------------------------|-------------------|
| – LOGIC                  | RTRIG             |

- Name the blocks **RTRIG1** and **RTRIG2**
- Wire the blocks to the two inputs of the Message Block

6 - 50

## Notes

### Configuring Send Flag Inputs

For information only type messages, the client trigger sets the corresponding SENDFLAG[n] to True. Since the SENDFLAG[n] is a pulse trigger, it is automatically set to False for the next execution cycle. This means the MESSAGE block is ready to send the same message again in the next cycle

Here we will be adding parameter connections which will be true as long as the monitored device is in Safety Interlock. If we wire the parameter connections directly to the Send Flag inputs, the messages will be sent each cycle, in our case once every second as long as the connection parameter is true.

We are therefore using a Rising-Trigger logic block to insure only one message is sent. The RTRIG block provides rising edge change detection, thereby turning the output ON if an OFF-to-ON transition is detected. The output stays ON until the next execution cycle, at which time it returns to OFF.

## Adding and Configuring Message Blocks ...continued

- Add a parameter connection to each RTRIG Block input to monitor occurrences of Transfer A Safety Interlocks:

- **CM#\_FV101.DEVCTLA.SI**
- **CM#\_FV101RC.PIDA.SIFL**

Repeat this procedure for the other two Message Blocks

- For **XFERB**: Three messages, Index 0 and 1: INFO type messages; Index 2 CONFIRM
  - Index 0: **CM#\_FV102 SAFETY INTERLOCK --- FULL REACTOR**
  - Index 1: **TRANSFER B COMPLETE** (*Used in a later lab*)
  - Index 2: **PLEASE CHARGE ING. B, CONFIRM WHEN COMPLETE**  
(*Used in a later lab -- CONFIRM type message*)

6 - 51

## Notes

### Configuring Send Flag Inputs

The SI and SIFL parameters can be used to monitor Safety Interlock status. They go true when a Safety Interlock is triggered.

The RTRIG Block will detect when the SI and SIFL parameters go true and send true outputs to the appropriate Send Flags for one cycle only. The corresponding messages will be sent once to the Server's Message Summary.

## Adding and Configuring Message Blocks ...continued

- **XFER\_B** continued
  - **RTRIG3** input: **CM#\_FV102.DEVCTLA.SI** (Trigger for Message 0)
- For **REACTOR**: One INFO type message
  - Index 0: **CM#\_AGIT101 SAFETY INTERLOCK --- EMPTY REACTOR**
  - **RTRIG4** input: **CM#\_AGIT101.DEVCTLA.SI**
- Compare your CM to the solution on the next page. If you are satisfied, close and save your CM.
- Assign your CM to **CEE0101**, Load and Activate
- Test the Message functionality by causing your Reactor to reach the PV High-High level, and then draining to the PV Low-Low level
- Acknowledge the resulting messages to clear them from the Station Message Summary

6 - 52

## Notes

### Information Messages in Station

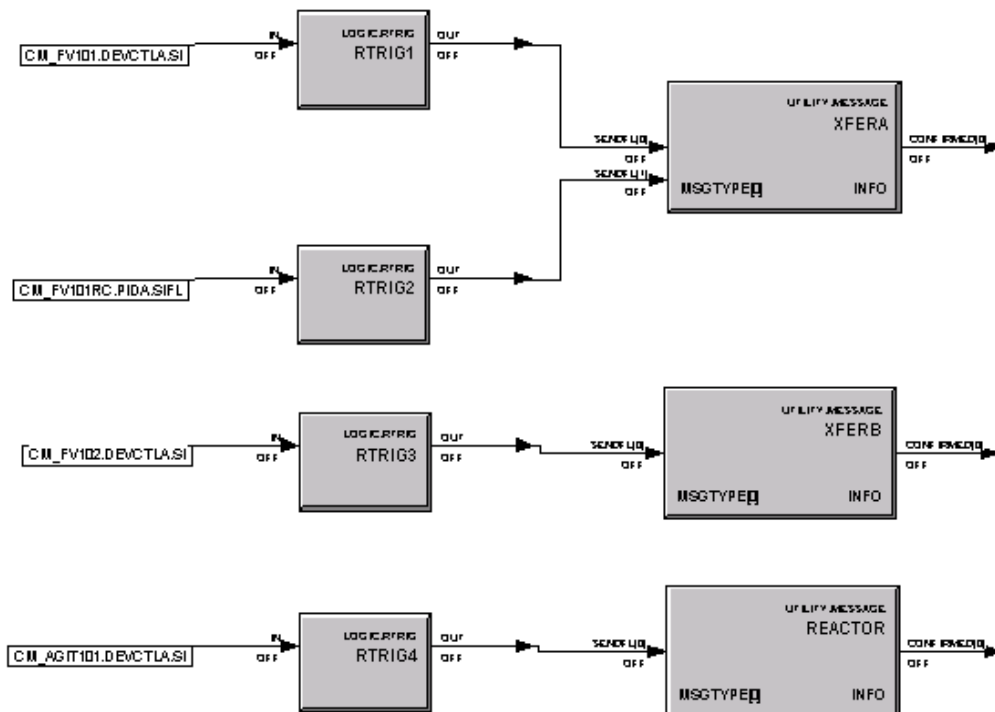

Here we are sending Information type messages when the process encounters Safety Interlocks.

INFO type messages are for information only. They are removed from the Message Summary upon Acknowledgement

The CONFIRM message will be sent in a later lab.

**Honeywell**

## Adding and Configuring Message Blocks ...continued

6 - 53

## Notes

### CM#\_MESSAGES

Your final CM should be functionally equivalent to the above CM. Each Message Block is used to send messages to the Server Message Summary from different parts of the process.

## Unit 6 Exam

| QuesNo | Question                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1      | <p>Device control CMs can be interlocked by process conditions. Which of the following is not a device control block interlock mechanism?</p> <ul style="list-style-type: none"><li>A Safety override</li><li>B Process override</li><li>C Safety interlock option</li><li>D Process permissive</li></ul>                                                                                                                                                                                                                                                                                                                                |
| 2      | <p>If a device control CM is active in the one-state and its configured OI[0] parameter goes true, what will take place?</p> <ul style="list-style-type: none"><li>A The CM will go to its configured safe state and stay there until the OI[0] parameter goes false.</li><li>B The CM will stay in the one-state and not be allowed to go to the zero-state.</li><li>C The CM will go to the zero-state and stay there until the OI[0] parameter goes false.</li><li>D The CM will stay in the one-state, but not be allowed to return to the one-state after it goes to the zero-state until the OI[0] parameter goes false.</li></ul> |
| 3      | <p>If a device control CM is active in the one-state and its configured PI[1] parameter goes false, what will take place?</p> <ul style="list-style-type: none"><li>A The CM will go to its configured safe state and stay there until the PI[1] parameter goes true.</li><li>B The CM will stay in the one-state and not be allowed to go to the zero-state.</li><li>C The CM will go to the zero-state and stay there until the PI[1] parameter goes true.</li><li>D The CM will stay in the one-state, but not be allowed to return to the one-state after it goes to the zero-state, until the PI[1] parameter goes true.</li></ul>  |

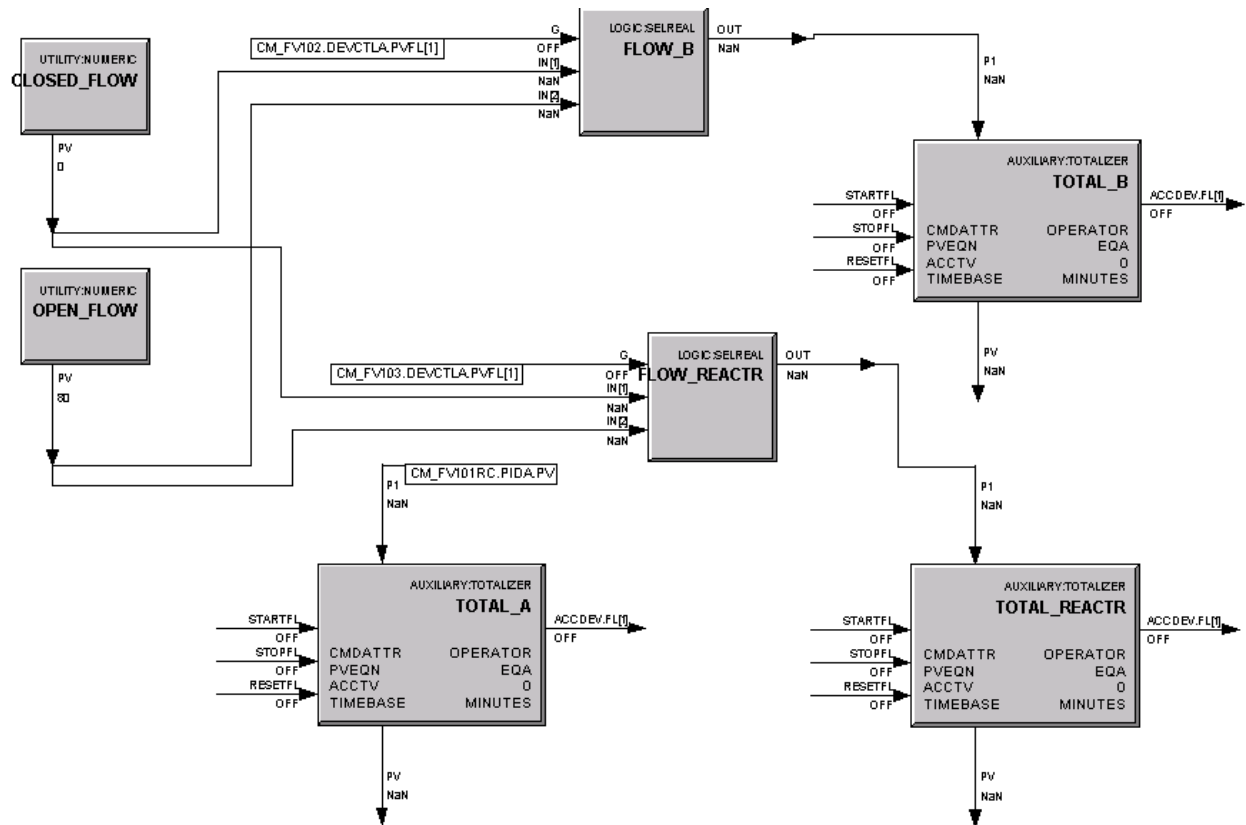

- 4        If a device control CM is active in the one-state and its configured SI parameter goes true, what will take place?
- A        The CM will go to its configured safe state and stay there until the SI parameter goes false.
  - B        The CM will stay in the one-state and not be allowed to go to the zero-state.
  - C        The CM will go to the zero-state and stay there until the SI parameter goes false.
  - D        The CM will stay in the one-state, but not be allowed to return to the one-state after it goes to the zero-state until the SI parameter goes false.
- 5        One major difference between a safety override and a process override is that a process override can be by-passed while a safety override cannot.
- A        True
  - B        False
- 6        What is the interlock mechanism for a regulatory control block?
- A        Safety override
  - B        Process override
  - C        Safety interlock option enabled with a safe OP configured
  - D        Process permissive

# **PlantScape Controller Implementation**

## **Lesson 1**

# **PlantScape Hardware Configuration**

---

2 - 3

---

### **Notes**

#### **Introduction**

The purpose of this Lesson is to introduce you the typical PlantScape hardware configuration. After you complete this Lesson you should be able to identify and understand the uses of the individual components of the PlantScape System.

#### **Objectives**

- ❶ Given a statement on hardware slot locations, determine whether the statement is correct
- ❷ Given a statement regarding the communication hardware of the PlantScape system, identify the correct use of a particular hardware module

**Honeywell**

## PlantScape System Architecture

2 - 4

## Notes

### PlantScape System Architecture

The PlantScape server, the heart of the system

- Consists of a standard Pentium chip computer
- Acts as the central repository for all system data

The server also runs all the core system functions, including

- Data acquisition and processing
- Alarm and event management
- History collection, archiving and trending, report generation
- Specialist and user applications (TPH), (TPB)

The server also supports the operator station client personality, enabling systems to “start small” with just one box.

Additional operator stations may be connected via standard local & wide area networks.

Full-function operator stations may also be connected remotely via dial-up communication

**Honeywell**

## **PlantScape Rack**

### **Rack Components**

2 - 5

### **Notes**

#### **Rack Components**

- ❶ The power supply is always the first, left end module. It is separate from the rack and does not consume any slots. It operates on 115/230 VAC or 24VDC.
- ❷ The rack has available capacity for 4, 7, 10, 13 and 17 slots. It is used for processor and I/O interface to plant equipment. The rack features removal and insertion under power, which ensures the automated control system can continue operation while various options are modified.
- ❸ The ControlNet interface module is the PlantScape communications interface. It supports supervisory/peer and I/O network communications. In I/O communications one CNI can support a maximum of 16 I/O modules
- ❹ C200 Control Processor modules are double wide, 2 board assemblies that provide the hybrid control.
- ❺ I/O modules support analog, digital AC and digital DC.

## PlantScape Rack Configuration

### Standard Configuration

- Below is an example of the rack configured with
  - ❶ 7 slot chassis
  - ❷ Power supply
  - ❸ ControlNet Interface (CNI)
  - ❹ Control Processor (C200)
  - ❺ Input Output Modules

2 - 6

### Notes

#### Configuring the Controller CNet address

The controller CNet address is set on two rotary switches on the CNI module. One Hybrid controller must have an address of 1. It is the “keeper” of the CNet communication parameters. These parameters are specified in the *ControlNet Installation Guide*.

The power unit is not part of the slot number sequence. Begin counting with the first slot next to the power unit.

**Honeywell**

## Determining Slot Numbers

### Finding the location of hardware in your chassis

- To determine the IOM Slot Number you must:
  - Count starting at zero
  - Count from left to right
  - Count both spaces if the module occupies two spaces

2 - 7

**Notes**

**Honeywell**

## Control Processor Module

- 2 board, double-wide module
- 100 MHz PowerPC microprocessor
- Memory
  - 8 Mbyte RAM with EDAC
  - 4 Mbyte Flash ROM with EDAC (upgrades w/o a new chip)
- Built in lithium battery; Optional rechargeable Battery Extension Module
- Supports up to 64 I/O modules

2 - 8

## Notes

### Control Processor Module: LED Indicators

| <u>States</u> | <u>Definition</u>                      |
|---------------|----------------------------------------|
| RUN           | - loaded and operating                 |
| IDLE          | - loaded and not processing            |
| NODB          | - personality loaded, no configuration |
| RDY           | - inactive and ready to be loaded      |
| ALIV          | - alive; base software not loaded      |
| FAIL          | - hardware/software failure            |

### BATtery and OK indicator LEDs

Battery LEDs should be lit when OK is lit; otherwise the Battery has failed

**Honeywell**

## PlantScape Rack I/O

- I/O modules are configured via Control Builder
- Removable Wiring Hood
  - Includes a wire tie slot
  - Protects wiring while removed from module
  - Removable hood to gain termination access
- Choice of Removable Terminal Block (RTB) style
  - 20 position RTB (8 point or less I/O modules)
  - 36 position RTB (16 point I/O modules)
- Termination Connector
  - Supports “Removal & Insertion under Power” for field termination *and* backplane connectors
  - Door opens to provide a handle for connector removal
- 5” x 5” I/O modules

Always check hardware wiring specifications in the Control Hardware Installation Guide before wiring any Modules

2 - 9

## Notes

### Rack I/O LED Indicators

| <u>LED</u> | <u>Display</u> | <u>Definition</u>                                |
|------------|----------------|--------------------------------------------------|
| OK         | steady green   | normal operations                                |
| OK         | flashing green | passed internal diagnostics, but not operational |
| OK         | flashing red   | communications time-out                          |
| OK         | steady red     | replace module                                   |
| I/O State  | yellow         | active I/O (point active)                        |
| I/O Fault  | red            | point failed                                     |
| Cal        | flashing green | calibration mode                                 |

**This completes....**

**PlantScape Controller Implementation**

**Lesson 1**

**PlantScape Hardware Configuration**
